

Edexcel (A) Economics A-level

**Theme 1: Introduction to Markets and  
Market Failure**

**1.2 How Markets Work**

**1.2.6 Price determination**

**Notes**

## **Equilibrium price and quantity**

 This is when supply meets demand. On the diagram, this is shown by  $P_1$  and  $Q_1$ .

 At market equilibrium, price has no tendency to change, and it is known as the **market clearing price**.

## **Excess demand**

 At  $Q_2$ , price is at  $P_2$  which is below market equilibrium. Demand is now greater than supply, which can be calculated by  $Q_3 - Q_2$ .

 This is a **shortage** in the market. This pushes prices up and causes firms to supply more. Since prices increase, demand will contract.

 Once supply meets demand again, price will reach the market clearing price,  $P_1$ .

## **Excess supply**

 This is when price is above  $P_1$ .

 Supply is now at  $Q_2$  and demand is at  $Q_1$ . There is a **surplus** of  $Q_2 - Q_1$ . Price will fall back to  $P_1$  as firms lower their prices and try to sell their goods. The market will clear and return to equilibrium.

## **New market equilibriums**

 When the demand or supply curves shift due to the PIRATES or PINTSWC reasons, new market equilibriums are established.

-  For example, if there was an increase in the size of the population, demand would shift from D1 to D2.
-  Price would increase to P2 and suppliers would supply a larger quantity of Q2. A new market equilibrium is established at P2 Q2.
