

## Worked Solutions

### Edexcel C3 Paper H

1.  $x^2 - y^2 = (x - y)(x + y)$

Assume both  $x$  and  $y$  are even then  $x - y = 2m$  where  $m$  is an integer.

$$x + y = 2n \quad \text{where } n \text{ is an integer.}$$

$$\therefore x^2 - y^2 = 4mn \neq 18$$

Assume both  $x$  and  $y$  are odd then  $x - y = 2m'$

$$x + y = 2n'$$

$$\therefore x^2 - y^2 = 4m'n' \neq 18$$

Assume  $x$  odd,  $y$  even then  $x - y = 2m_1 + 1$  odd

$$x + y = 2m_2 + 1 \quad \text{odd}$$

$$\therefore x^2 - y^2 = 4m_1m_2 + 2(m_1 + m_2) + 1 \quad \text{which is odd} \quad \therefore \text{contradiction.} \quad (6)$$

2. 
$$\frac{(2x-1)(x+3)}{(2x-1)(2x+1)} \times \frac{x(2x+1)}{(x+3)(x+5)} = \frac{x}{x+5} \quad (6)$$

3. (a)  $y = 2x - 1 \quad \therefore 2x = y + 1$

$$f^{-1}: x \mapsto \frac{x+1}{2}, \quad x \in \mathbb{R} \quad (2)$$

(b)  $gf^{-1}(x) = 3\left(\frac{x+1}{2}\right)^2 + 1 \quad (2)$

(c)  $3\left(\frac{x+1}{2}\right)^2 + 1 = \frac{7}{4}$

$$3(x+1)^2 + 4 = 7$$

$$(x+1)^2 = 1$$

$$x = 0 \text{ or } -2$$

4. (a)  $x$  must be obtuse.

$$\therefore \tan x < 0, \sin x > 0$$

$$\cos^2 x = \frac{25}{169}$$

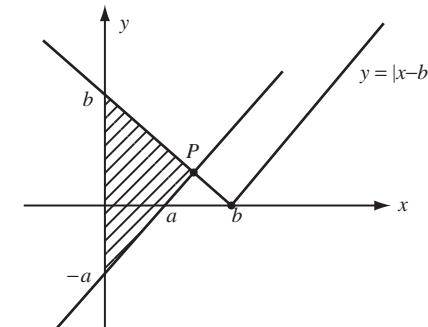

$$\tan^2 x = \sec^2 x - 1 = \frac{169}{25} - 1 = \frac{144}{25}$$

$$\tan x = -\frac{12}{5} \quad (4)$$

(b)  $\operatorname{cosec} 2x = \frac{1}{2 \sin x \cos x}$

$$= \frac{1}{2 \cdot \frac{12}{13} \cdot \frac{-5}{13}} = \frac{-169}{120} \quad (4)$$

5. (a)

(b) at  $P \quad x - a = -(x - b)$

$$x - a = -x + b$$

$$x = \frac{a+b}{2}$$

$$\text{Area} = \frac{1}{2}(b+a)\left(\frac{a+b}{2}\right) = \frac{(a+b)^2}{4} \quad (4)$$

6.  $y = \ln(3 - x)$

$$y = \ln(x + 2) - 2$$

$$\ln(3 - x) = \ln(x + 2) - 2$$

$$\ln(x + 2) - \ln(3 - x) = 2$$

$$\frac{x + 2}{3 - x} = e^2$$

$$x + 2 = 3e^2 - xe^2$$

$$x(1 + e^2) = 3e^2 - 2$$

$$x = 2.40 \quad (2 \text{ d.p.})$$

$$y = -0.52 \quad (2 \text{ d.p.})$$

---

7. (a) (i)  $x \cdot \frac{3}{3x + 4} + \ln(3x + 4)$

(8)

(3)

(ii)  $5(3x^2 + 7)^4 \cdot 6x$

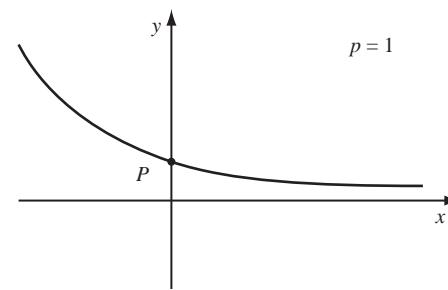

$$30x(3x^2 + 7)^4$$

(3)

(b)  $\frac{d}{dx} \left( \frac{\cos x}{\sin x} \right)$   
 $= \frac{-\sin x \cdot \sin x - \cos x \cdot \cos x}{\sin^2 x}$   
 $= \frac{-1}{\sin^2 x} = -\operatorname{cosec}^2 x$

(4)

8. (a)

(2)

(b)  $\frac{dy}{dx} = -\frac{1}{2}e^{-\frac{1}{2}x} \text{ at } x = q : \quad \frac{dy}{dx} = -\frac{1}{2}e^{-\frac{1}{2}q}$

$$\text{gradient of normal} = 2e^{\frac{1}{2}q}$$

$$\text{Equation of normal is } y = 2e^{\frac{1}{2}q}x$$

$$\text{pt. } Q \text{ lies on curve} \therefore e^{-\frac{1}{2}q} = 2e^{\frac{1}{2}q}q$$

$$1 = 2e^q q$$

$$\therefore q \text{ satisfies } 2e^x x - 1 = 0$$

$$2e^x x = 1$$

$$x = \frac{1}{2e^x}$$

$$x_1 = 0.33516, x_2 = 0.35761, x_3 = 0.34967, x_4 = 0.35246$$

$$q = 0.352 \quad (3 \text{ d.p.})$$

---

9. (a) (i)  $R^2 = 9^2 + 40^2$

$$R = 41$$

$$\tan \alpha = \frac{9}{40}$$

$$\alpha = 12.68$$

(ii)  $41 \cos(\theta + 12.68) = 4$

(4)

$$\theta + 12.68 = 84.40$$

$$\theta = 71.7(1 \text{ d.p.})$$

(3)

(b)  $6 \sin^2 \theta - \sin \theta - 2 = 0$

$$(2 \sin \theta + 1)(3 \sin \theta - 2) = 0$$

$$\sin \theta = -\frac{1}{2}, \text{ no solutions}$$

$$\sin \theta = \frac{2}{3}, \quad \theta = 41.8^\circ, 138.2^\circ$$

(5)
