Physics Advanced Subsidia Unit 2: Physics at W			
Thursday 21 May 2009 – A Time: 1 hour 20 minutes			Paper Reference 6PH02/01
You do not need any other m	naterials.		Total Marks

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
 - there may be more space than you need.

Information

- The total mark for this paper is 80.
- The marks for **each** question are shown in brackets
 - use this as a guide as to how much time to spend on each question.
- Questions labelled with an asterisk (*) are ones where the quality of your written communication will be assessed
 - you should take particular care with your spelling, punctuation and grammar, as well as the clarity of expression, on these questions.
- The list of date, formulae and relationships is printed at the end of this booklet.
- Candidates my use a scientific calculator.

Advice

- Read each question carefully before you start to answer it.
- Keep an eye on the time.
- Try to answer every question.
- Check your answers if you have time at the end.

SECTION A

Answer ALL questions.

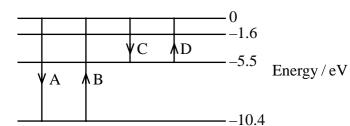

For questions 1–10, in Section A, select one answer from A to D and put a cross in the box \boxtimes . If you change your mind, put a line through the box \boxtimes and then mark your new answer with a cross \boxtimes .

		mark your new answer with a cross ⊠.
1	A volt	can be defined as
	X	A a coulomb per joule
	\times	B a coulomb per second
	\boxtimes	C a joule per coulomb
	\times	D a joule per second
		(Total for Question 1 = 1 mark)
2	Which	of the following electromagnetic radiations has the highest frequency?
	\boxtimes	A infrared
	\boxtimes	B radio
	\boxtimes	C ultraviolet
	\times	D X-rays
		(Total for Question 2 = 1 mark)
3	Which	of the following properties could not be demonstrated using sound waves?
	\boxtimes	A diffraction
	\times	B polarisation
	X	C reflection
	\times	D refraction
		(Total for Question 3 = 1 mark)

The	
X	$\mathbf{A} \ 0.5 \ \Omega$
X	$\mathbf{B} \ 2 \Omega$
X	$\mathbf{C} + 4 \Omega$
X	$\mathbf{D} 8 \Omega$
	(Total for Question 4 - 1 mont)
same	(Total for Question $4 = 1$ mark) am of light travels a distance X to arrive at a point. A second beam of light of the effequency and initially in phase with the first beam, travels a distance Y to arrive at a great point. A second beam of light of the e frequency and initially in phase with the first beam, travels a distance <i>Y</i> to arrive at ame point. For destructive interference to occur between these two beams, the path rence <i>X</i> – <i>Y</i> must equal A an odd number of wavelengths.
same the s diffe	am of light travels a distance <i>X</i> to arrive at a point. A second beam of light of the efrequency and initially in phase with the first beam, travels a distance <i>Y</i> to arrive at same point. For destructive interference to occur between these two beams, the path rence <i>X</i> – <i>Y</i> must equal A an odd number of wavelengths. B an even number of wavelengths.

6 The diagram shows some of the electron energy levels for a mercury atom.

Which of the lines A to D, drawn on the diagram, would correspond to the emission of the photon with the shortest wavelength?

- \boxtimes A
- \boxtimes B
- \square D

(Total for Question 6 = 1 mark)

- 7 To be able to see smaller details in an ultrasound scan, you should
 - A decrease the frequency of the ultrasound
 - **B** decrease the wavelength of the ultrasound
 - C increase the duration of the pulse of the ultrasound
 - **D** increase the size of the screen to view the scan

(Total for Question 7 = 1 mark)

8 An earthquake wave travels in an east-west direction in rocks.

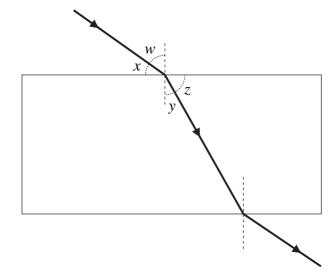

The rocks are vibrating in a north-south direction.

The wave must be classified as a

- A longitudinal wave
- **B** standing wave
- C stationary wave
- **D** transverse wave

(Total for Question 8 = 1 mark)

9 The refractive index of glass can be found by tracing a ray of light through a block of glass and measuring angles.

Which of the following expressions is equal to the refractive index of glass?

- \triangle A $\frac{\sin w}{\sin y}$
- \square **B** $\frac{\sin y}{\sin w}$
- \square C $\frac{\sin x}{\sin z}$
- \square **D** $\frac{\sin z}{\sin x}$

(Total for Question 9 = 1 mark)

10 Two wires of the same material are connected in series with each other. Wire A has twice the diameter of wire B. In which of the following rows are both statements correct?

		current in wire A	drift speed in wire A
		current in wire B	drift speed in wire B
×	A	1	$\frac{1}{4}$
×	В	1	4
×	C	2	4
×	D	2	$\frac{1}{4}$

(Total for Question 10 = 1 mark)

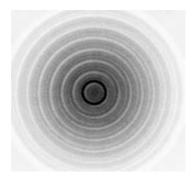

TOTAL FOR SECTION A = 10 MARKS

SECTION B

Answer ALL questions in the spaces provided.	
11 A cell of e.m.f. 1.5 V is connected to a lamp of resistance 80Ω . The current in the circuit is 17 mA.	
Calculate the internal resistance of this cell.	
	•••
Internal resistance =

13 The diagram shows a diffraction pattern.

(a) Explain	what is meant by diffraction.	

(2)

(b) This diffraction	pattern is	s produced	by electrons	passing	through a	thin	sheet	of
graphite.								

(i) State what this suggests about the behaviour of electrons.

(1)

(ii) Suggest why substantial diffraction occurs.

(1)

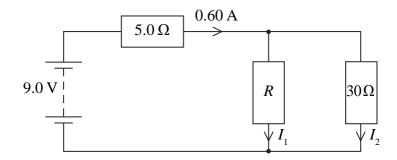

(Total for Question 13 = 4 marks)

What name is given to this effect?	
	(1)
Describe and explain how the movement of the ambulance causes the fraction in the sound he hears to change.	equency of
	(3)
Suggest have what he have would be different if the ambulance was no	ovino foston
Suggest how what he hears would be different if the ambulance were me	oving faster. (2)

15 The circuit diagram shows a battery of negligible internal resistance connected to three resistors.

(a)	Calculate	the	potential	difference	across	the	5Ω	resistor.
()	~		Potentia					100101011

(2)

Potential difference =

(b) Calculate the current
$$I_2$$
.

(2)

(c) Calculate the resistance R.

(2)

 $R = \dots$

(Total for Question 15 = 6 marks)

*16	A student is asked to explain which of two filament lamps will be brighter when they are connected in parallel across a power supply. She is told that the resistance of lamp A is greater than the resistance of lamp B.
	The student wrote the following explanation that contains some mistakes:
	"The current is the same in both lamps. Because lamp A has a higher resistance, it is harder for the electrons to move through this lamp so they will lose more energy. Lamp A will therefore be brighter than lamp B."
	Write a correct explanation.
	(Total for Question 16 = 5 marks)

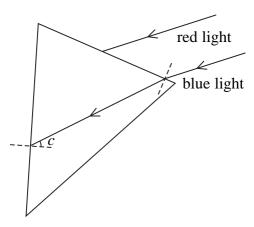

17 The energy level diagram shows the ground state and two excited states E_1 and E_2 of a neon atom.	
$\phantom{aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa$	
$\phantom{aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa$	
———— ground state	
In a helium neon laser, collisions occur between helium atoms and neon atoms. This results in the helium neon atoms being excited from the ground state to level E_2 . They then emit photons and move to level E_1 .	
(a) What is meant by 'energy level'?	(1)
(b) What is a photon?	(1)
(c) Write a formula in terms of E_1 and E_2 for the energy of an emitted photon.	(1)
(d) The wavelength of an emitted photon is 6.33×10^{-7} m. Calculate the energy of this photon.	
	(3)
Energy =

18	The following passage describes some important aspects of the photoelectric effect. Insert the missing words.
	In the photoelectric effect, a single interacts with a single electron
	at the surface of a
	conserved. This was summarised by Albert Einstein in the following equation
	$hf = \Phi + \frac{1}{2}mv^2$
	where $\frac{1}{2}mv^2$ is the maximum kinetic energy of the
	and Φ is the

(Total for Question 18 = 5 marks)

19 Two parallel rays of light, one blue, one red, are travelling in air and are incident on one side of a glass prism. The blue light passes into the prism and meets the second face at the critical angle as shown in the diagram.

(a)	Add to the diagram	n the path	of the	blue	light	after	it meets	the	second f	ace.	Label
	this path X.										

(1)

(b) (i) The speed of blue light in the glass prism is 1.96×10^8 m s⁻¹.

Calculate the refractive index of this glass for blue light.

(2)

Refractive angle =

(ii) Calculate the critical angle for blue light in this glass prism.

(2)

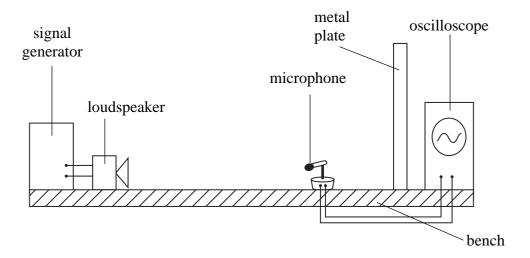

Critical angle =

(c) The refractive index of this glass for red light is less than for blue light. Add to the diagram to complete the path of the red light through the prism. Label this path Y.

(2)

(Total for Question 19 = 7 marks)

*20 The diagram shows an experiment with sound waves.

A loudspeaker is connected to a signal generator. A microphone is connected to an oscilloscope. Sound waves reach the microphone directly from the loudspeaker and after reflection from the metal plate.

As the microphone is moved towards the loudspeaker, the amplitude of the wave displayed on the oscilloscope varies through a series of maxima and minima.

(;	a) Exp	plain why the amplitude of the sound varies in this way.	(4)
(1	b) (i)	The distance moved by the microphone between two adjacent maxima is $0.050\mathrm{m}$.	
		Calculate the wavelength of the sound wave.	(2)

Wavelength =

(ii)	The	frequency	of	the	sound	wave	is	3.3	kHz
------	-----	-----------	----	-----	-------	------	----	-----	-----

Calculate the speed of sound in air.

(2)

Speed of sound in air =

(c) The microphone is placed close to the loudspeaker and gradually moved towards the metal plate. The graph shows how the amplitude of the wave displayed on the oscilloscope varies with the position of the microphone.

Amplitude

O 5 10 15 20 25

Distance between loudspeaker

and microphone / cm

(i) Explain why the minima never have a zero value.

(ii) As the microphone is moved towards the metal plate, the amplitudes at the minima gradually decrease. Suggest why this happens.

(4)

(Total for Question 20 = 12 marks)

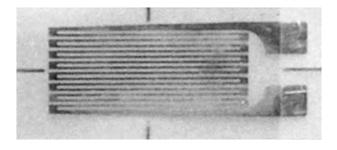

21	The aircraft industry uses an instrument called a resistance strain gauge to determine the strain in propellers. The resistance strain gauge is based on the principle that the electrical resistance of a wire changes when it is stretched.								
	(a) A stretched wire becomes longer and thinner. Using an equation to justify your answer, explain what effect stretching a length of wire would have on its resistance.	(3)							
	(b) The diagram shows a typical resistance strain gauge. The wire in the gauge is arranged in a zigzag pattern.								
	plastic								
	strain gauge fine iron wire								
	The length of the zigzag pattern is 2.50 cm and the cross-sectional area of the iron wire is $9.0 \times 10^{-8} \text{m}^2$. The resistivity of iron is $9.9 \times 10^{-8} \Omega$ m.								
	Show that the total resistance of the strain gauge is about 0.2Ω .	(3)							

(c) (i)	A wire of length l and cross-sectional area A is stretched. Assuming the volum V of the wire remains constant $V = lA = \text{constant}$	me
	Show that the resistance of the wire is directly proportional to l^2 .	(2)
(ii)	The length of the zigzag pattern, when under strain, increases to 2.51 cm.	
	Calculate the increase in resistance of the wire in the gauge.	(3)
	Increase in resistance =	

(d) In practice, very small changes in length are to be determined and the gauge itself has to be reasonably small. Consequently, the gauge is made of a length of very fine iron wire which is arranged in a zigzag pattern between two thin sheets of plastic.

What is the benefit of the iron wire being in this p	oattern?	
	(2)
