**H420/01 Biological Processes**

**Question Set 14**

14 (a) (i) A scientist used a respirometer to investigate the rate of respiration and photosynthesis of maize in different light intensities.

- The scientist placed ten maize seedlings in a respirometer and kept it in the dark for three hours.
- The respirometer contained soda-lime to remove any CO<sub>2</sub> produced by the seedlings.
- The scientist placed ten maize seedlings in a separate respirometer without soda-lime and placed it in different light intensities for three hours at a time.

Light intensity(lux)	Distance moved by fluid in respirometer (mm)
0	-3.7
1020	-0.8
1510	0.0
1700	1.2
2000	2.9

Table 22.1

The diameter of the capillary tubing was 0.1 mm.

The volume of a cylinder can be calculated using the following formula:

$$\text{volume of cylinder} = \pi r^2 l$$

Calculate the **rate of oxygen uptake** by the seedlings in the dark. Give your answer to **two** significant figures. Show your working.

Answer = ..... mm<sup>3</sup>h<sup>-1</sup> [3]

14 (a) (ii) 1700 lux is a typical light intensity on a cloudy day in the UK.

Calculate the percentage increase in gas production between 1700 and 2000 lux. Show your working.

Answer = ..... % [2]

14 (a) (iii) Suggest why soda-lime was **not** placed in the respirometer with the seedlings grown in the light. [1]

14 (b) The scientist made the following claim:

*These results suggest that, in maize seedlings, the rate of photosynthesis exceeds the rate of respiration only when the light intensity is above 1510 lux.*

Use the data in Table 22.1 to explain why the scientist made this claim. [2]

**Total Marks for Question Set 14: 8**
