Question Set 19

1. Plants need water to survive.

(a) Water enters plants through the roots. Most roots are covered in root hairs.

The number of root hairs per mm² of root surface is described as the density of root hairs. The density of root hairs can vary between and within species.

A scientist examined a plant root. The plant root had a diameter of 2 mm. In 1 mm of root **length** the scientist counted 440 root hairs.

Calculate the density of root hairs on the root the scientist examined. Use the formula:

$$\text{Surface area of cylinder} = 2\pi r(r + l)$$

Give your answer to **2** significant figures.

density = [3]

(b) A scientist investigated the effect of different mineral solutions on root hair density on cress plants.

Cress plants were grown for seven days in two different mineral solutions, **A** and **B**.

The results are shown in the table below.

Cress plant	Root hair density (hairs mm ⁻²)	
	Mineral solution A	Mineral solution B
1	42	25
2	53	41
3	60	32
4	52	34
5	38	58
6	48	27
Mean	48.8	
Standard deviation	8.0	

(i) Calculate the standard deviation of root hair density for cress grown in mineral solution **B**.

Use the formula: $s = \sqrt{\frac{\sum(x - \bar{x})^2}{n - 1}}$

[Write your answer in the table]

[3]

- (ii) The scientist thought that mineral solution **B** might cause a reduction in root hair density.

Suggest an appropriate statistical test that the scientist could carry out in order to confirm their hypothesis.

[1]

- (c) Fig. 24 is a section through xylem tissue from a **stem** of a dicotyledonous plant.

Fig. 24

- (i) Identify **A**, **B** and **C** on Fig. 24.

A

B

C

[3]

- (ii) Some plants, such as mosses, do not have xylem. Mosses are small plants that rarely grow more than a few cm in height.

Suggest why mosses do not need structures such as roots or xylem to survive.

[1]
