**Question Set 6**

1 Simplify fully.

(a)  $\sqrt{12a} \times \sqrt{3a^5}$  [2]

(b)  $(64b^3)^{\frac{1}{3}} \times (4b^4)^{-\frac{1}{2}}$  [2]

(c)  $7 \times 9^{3c} - 4 \times 27^{2c}$  [4]

2

The diagram shows points  $A$  and  $B$ , which have position vectors  $\mathbf{a}$  and  $\mathbf{b}$  with respect to an origin  $O$ .  $P$  is the point on  $OB$  such that  $OP : PB = 3:1$  and  $Q$  is the midpoint of  $AB$ .

(a) Find  $\overrightarrow{PQ}$  in terms of  $\mathbf{a}$  and  $\mathbf{b}$ . [2]

The line  $OA$  is extended to a point  $R$ , so that  $PQR$  is a straight line.

(b) Explain why  $\overrightarrow{PR} = k(2\mathbf{a} - \mathbf{b})$ , where  $k$  is a constant. [2]

(c) Hence determine the ratio  $OA : AR$ . [4]

3 A mobile phone company records their annual sales on 31<sup>st</sup> December every year.

Paul thinks that the annual sales,  $S$  million, can be modelled by the equation  $S = ab^t$ , where  $a$  and  $b$  are both positive constants and  $t$  is the number of years since 31<sup>st</sup> December 2015.

Paul tests his theory by using the annual sales figures from 31<sup>st</sup> December 2015 to 31<sup>st</sup> December 2019. He plots these results on a graph, with  $t$  on the horizontal axis and  $\log_{10} S$  on the vertical axis.

(a) Explain why, if Paul's model is correct, the results should lie on a straight line of best fit on his graph. [3]

The results lie on a straight line of best fit which has a gradient of 0.146 and an intercept on the vertical axis of 0.583.

(b) Use these values to obtain estimates for  $a$  and  $b$ , correct to 2 significant figures. [2]

(c) Use this model to predict the year in which, on the 31<sup>st</sup> December, the annual sales would first be recorded as greater than 200 million. [3]

(d) Give a reason why this prediction may not be reliable. [1]

4 (a) Differentiate  $(2+3x^2)e^{2x}$  with respect to  $x$ . [3]

(b) Hence show that  $(2+3x^2)e^{2x}$  is increasing for all values of  $x$ . [4]

5

The diagram shows the graph of  $y = |2x - 3|$ .

(a) State the coordinates of the points of intersection with the axes. [2]

(b) Given that the graphs of  $y = |2x - 3|$  and  $y = ax + 2$  have two distinct points of intersection, determine

(i) the set of possible values of  $a$ , [4]

(ii) the  $x$ -coordinates of the points of intersection of these graphs, giving your answers in terms of  $a$ . [3]

6 Find the general solution of the differential equation

$$(2x^3 - 3x^2 - 11x + 6) \frac{dy}{dx} = y(20x - 35).$$

Give your answer in the form  $y = f(x)$ . [9]
