Question Set 4

1

In this question, the unit vectors \mathbf{i} and \mathbf{j} are horizontal and vertically upwards respectively.

A particle has mass 2.5 kg.

- (a) Write the weight of the particle as a vector. [1]

The particle moves under the action of its weight and two external forces $(3\mathbf{i} - 2\mathbf{j})$ N and $(-\mathbf{i} + 18\mathbf{j})$ N.

- (b) Find the acceleration of the particle, giving your answer in vector form. [2]

2

Fig. 2 shows a train consisting of an engine of mass 80 tonnes pulling two trucks each of mass 25 tonnes.

Fig. 2

The engine exerts a driving force of D N and experiences a resistance to motion of 2000 N. Each truck experiences a resistance of 600 N. The train travels in a straight line on a level track with an acceleration of 0.1 ms^{-2} .

- (a) Complete the force diagram below to show all the forces acting on the engine and each of the trucks. [3]

Force diagram

- (b) Calculate the value of D . [2]

- (c) The tension in the coupling between the engine and truck A is larger than that in the coupling between the trucks. Determine how much larger. [2]

3

In this question you must show detailed reasoning.

A car accelerates from rest along a straight level road. The velocity of the car after 8 s is 25.6 ms^{-1} .

In one model for the motion, the velocity $v \text{ ms}^{-1}$ at time t seconds is given by $v = 1.2t^2 - kt^3$, where k is a constant and $0 \leq t \leq 8$.

- (a) The model gives the correct velocity of 25.6 ms^{-1} at time 8 s. Show that $k = 0.1$. [2]

A second model for the motion uses constant acceleration.

- (b) Find the value of the acceleration which gives the correct velocity of 25.6 m s^{-1} at time 8 s. [2]
- (c) Show that these two models give the same value for the displacement in the first 8 s. [5]

Total Marks for Question Set 4: 19 marks
