Question Set 14

1

$^{60}_{27}\text{Co}$ is produced by irradiating the stable isotope $^{59}_{27}\text{Co}$ with neutrons.

Each nucleus of $^{60}_{27}\text{Co}$ then decays into a nucleus of nickel (Ni) by the emission of a low energy beta-minus particle, one other particle and two gamma photons.

(a) Complete the nuclear equations for these two processes.

(b) Students want to carry out an investigation into gamma photon absorption using a source of $^{60}_{27}\text{Co}$.

They add sheets of lead between the source **S** and a radiation detector **T**, to give a total thickness d of lead. **S** and **T** remain in fixed positions, as shown in Fig. 2.1.

Fig. 2.1

(i) The $^{60}_{27}\text{Co}$ source emits beta radiation as well as gamma radiation.

Explain why this would not affect the experiment.

[1]

- (ii) The students record the number N of gamma photons detected by **T** in 10 minutes for each different thickness d of lead. The background count is negligible.

The results are shown in a table. The table includes values of $\ln N$, including the absolute uncertainties.

N	d/mm	$\ln N$
4300 ± 440	0	8.37 ± 0.10
2500 ± 250	10	7.82 ± 0.10
1400 ± 150	20	7.24 ± 0.11
800 ± 90	30	6.68 ± 0.11
500 ± 60	40	6.21 ± 0.12
300 ± 40	50	

N and d are related by the equation $N = N_0 e^{-\mu d}$ where N_0 and μ are constants.

1. The students decide to plot a graph of $\ln N$ against d .

Show that this should give a straight line with gradient = $-\mu$ and y -intercept = $\ln N_0$.

[1]

2. Complete the missing value of $\ln N$ in the table, including the absolute uncertainty.

Show your calculation of the absolute uncertainty in the space below.

[2]

3. |

3. In Fig. 2.2, five of the data points have been plotted, including error bars for $\ln N$.
- Plot the missing data point and error bar.
 - Draw a straight line of best fit and one of worst fit.

[2]

Fig.

Fig. 2.2

4. Use Fig. 2.2 to determine the value of μ in m^{-1} , including the absolute uncertainty.

$$\mu = \dots\dots\dots \pm \dots\dots\dots \text{m}^{-1} \text{ [4]}$$

5. Determine the thickness, $d_{1/2}$, of lead which halves the number of gamma photons reaching **T**.

$$d_{1/2} = \dots\dots\dots \text{m} \text{ [2]}$$
