Question Set 19

- 1 (a) Fig. 4 shows a circuit with five identical $60\ \Omega$ resistors. The battery has electromotive force (e.m.f.) 9.0V and negligible internal resistance.

Fig. 4

- (i) Show that the total resistance in the circuit is $50\ \Omega$.
Make your reasoning clear.

- (ii) Calculate the potential difference V across resistor Y.

[2]

$$V = \quad \quad \quad \text{V}$$

- (iii) Calculate the charge Q passing through resistor Y in two minutes (include an appropriate unit).

[2]

$$Q = \quad \quad \quad \text{unit}$$

- (iv) Calculate the energy W dissipated in resistor Y in two minutes.

[3]

$$W = \quad \quad \quad \text{J}$$

[1]

- (b) Explain how the mean drift velocity of electrons in resistor Y compares with the mean drift velocity of electrons in resistor Z.

- (c) Copper is a metal, carbon is a semiconductor and ceramic is an insulator.

[3]

Describe the difference between these three materials in terms of the number density n of free electrons. Include an explanation of the term **number density**.

[3]
