**J259/04** Depth in physics (Higher Tier)

**Question Set 8**

1

This question is about the radioactive isotope americium-241, which is found in smoke detectors.

The graph shows how the activity of a sample of americium-241, with an initial activity of 800 counts per second, would change with time

- (a) Use the graph to obtain an estimate of the half-life of americium-241. Show your working on the graph.

Half-life = ..... years [2]

- (b) Americium-241 decays by emitting alpha-particles.

A smoke detector is not a hazard in your house. They usually last 10 years.

Explain why a smoke detector should be disposed of carefully when it no longer works [4]

- (c) In schools, the decay of radioactive isotopes such as americium-241 can be modelled by a game rolling many dice. Each dice has 1 chance in 6 of showing a 'six' each time.

In a typical game, **100** dice are rolled onto a table.

The number showing six spots on the top are removed and counted.

The remaining dice are rolled again, and the process continued.

The results are put into a table. The following is an example for one game.

<b>Roll number</b>	1	2	3	4	5	6	7
<b>Number of sixes</b>	18	13	12	9	6	7	5
<b>Number of dice remaining</b>	82	69	57	48	42	35	30

Each 'roll number' stands for an equal interval of time.

- (i) What does the number of dice remaining at any roll stand for? **[1]**
- (ii) What does the number of sixes taken out in any roll stand for? **[1]**
- (iii) Explain why the data in this table suggest that the half-life is about 4 'rolls' but that it's not possible to be exact. **[3]**

**Total Marks for Question Set 8: 11**
