Paper 1: The Natural Environment and Species Survival

Monday 12 June 2017 – Afternoon

Time: 2 hours

Paper Reference

9BN0/01

You must have:

Calculator, HB pencil, ruler

Total Marks

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Show your working in any calculation questions and include units in your answer where appropriate.
- Answer the questions in the spaces provided
– *there may be more space than you need.*
- You may use a scientific calculator.
- In questions marked with an **asterisk** (*), marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.

Information

- The total mark for this paper is 100.
- The marks for **each** question are shown in brackets
– *use this as a guide as to how much time to spend on each question.*

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

Pearson

Answer ALL questions.

Write your answers in the spaces provided.

Some questions must be answered with a cross in a box ☒. If you change your mind about an answer, put a line through the box ☒ and then mark your new answer with a cross ☒.

1 At the start of fertilisation, many sperm cells will surround the ovum.

(a) Fertilisation begins with the acrosome reaction.

(i) Which of the following describes the acrosome reaction?

(1)

- A** the ovum releases enzymes that digest the egg cell membrane
- B** the ovum releases enzymes that digest the zona pellucida
- C** the sperm cell releases enzymes that digest the egg cell membrane
- D** the sperm cell releases enzymes that digest the zona pellucida

(ii) Which of the following statements describes the genetic content of a sperm cell?

(1)

	Each sperm cell will contain	Different sperm cells will contain
<input type="checkbox"/> A	one copy of each gene	different alleles of some genes
<input type="checkbox"/> B	one copy of each gene	the same alleles for all genes
<input type="checkbox"/> C	two copies of each gene	different alleles of some genes
<input type="checkbox"/> D	two copies of each gene	the same alleles for all genes

(b) Describe the events of fertilisation that occur after the acrosome reaction.

- (ii) The concentration of potassium ions inside an animal cell is many times higher than the concentration of potassium ions in the extracellular fluid.

Which mechanism is responsible for the uptake of potassium ions by this animal cell?

(1)

- A active transport
- B exocytosis
- C osmosis
- D passive diffusion

- (iii) Glucose enters cells by facilitated diffusion.

Which part of the cell surface membrane allows facilitated diffusion of glucose?

(1)

- A cholesterol
- B glycolipid
- C phospholipid
- D protein

- (c) Some epithelial cells in the lungs secrete mucus. If the mucus is too 'sticky', it cannot be easily removed from the lungs.

Other epithelial cells in the lungs contain CFTR proteins in their cell surface membranes.

- (i) Describe the role of the CFTR protein in ensuring that the mucus produced in the lungs has the right consistency.

(b) In an experiment, a mixture of radioactive bases was added to a culture of dividing bacteria.

The results are shown in the graph.

(i) Calculate the fastest rate of uptake of bases by these bacteria.

(2)

Answer

(ii) Deduce how many times the bacteria in the culture have divided during this experiment.

(2)

(iii) Explain why the experiment would be improved if all the bases were provided but only the thymine was radioactive.

(2)

(c) Antibiotics can be used to control bacterial infections.

In an experiment, a culture of bacteria was grown in nutrient broth. The culture was then divided into three separate cultures, A, B and C. The bacterial cultures were grown for 200 minutes.

After 200 minutes the antibiotic tetracycline was added to culture A and the antibiotic penicillin was added to culture B. No antibiotics were added to culture C.

The three cultures were grown for a further 200 minutes.

The results of the experiment are shown in the graph.

Deduce the effects of these antibiotics on the growth of the bacterial cultures.

(b) The products of the light-dependent reactions are used in the light-independent reactions.

(i) In which part of the chloroplast do the light-independent reactions take place? (1)

- A envelope
- B granum
- C stroma
- D thylakoid

(ii) What is the name of the enzyme used by plants to fix carbon dioxide? (1)

- A GALPase (glyceraldehyde-3-phosphatase)
- B GPase (glycerate-3-phosphatase)
- C RUBISCO (ribulose bisphosphate carboxylase/oxygenase)
- D RuBPase (ribulose bisphosphatase)

(iii) Which of the following is the immediate product of the light-independent reactions of photosynthesis? (1)

- A glucose
- B GP
- C RuBP
- D starch

(Total for Question 4 = 8 marks)

5 Climate change has been correlated with changing atmospheric carbon dioxide levels.

(a) Scientists studying climate change have examined peat bogs to observe pollen grains such as those shown in the photograph.

Explain how studying pollen grains in peat bogs can provide evidence of climate change. (4)

(b) Scientists measured the productivity of two types of forest and recorded the mass of carbon taken up per square metre per year ($\text{gC m}^{-2} \text{y}^{-1}$).

The table shows data on the mean net primary productivity (NPP) and mean gross primary productivity (GPP) of these two types of forest.

Type of forest	Mean NPP / $\text{gC m}^{-2} \text{y}^{-1}$	Mean GPP / $\text{gC m}^{-2} \text{y}^{-1}$	Ratio of NPP to GPP
Boreal	322	1013	0.32
Temperate deciduous	1301	2165	0.60

(i) Calculate the percentage increase in mass of carbon released due to respiration by temperate deciduous forests compared with that by boreal forests.

(3)

.....%

(ii) The ratio of net primary productivity to gross primary productivity is a measure of the ability of forests to transfer carbon from the atmosphere into biomass.

Scientists concluded that temperate deciduous forests would reduce levels of carbon dioxide in the atmosphere more than boreal forests.

Justify this conclusion.

6 Fibrin is involved in the formation of blood clots.

Thrombin is an enzyme that converts fibrinogen to fibrin.

- (a) The graph shows the effect of one concentration of thrombin on the conversion of fibrinogen to fibrin.

- (i) Calculate the initial rate of reaction.

(2)

Answer

- (ii) On the graph, draw a line to show the effect of halving the concentration of thrombin.

(1)

7 In birds and mammals, gas exchange takes place between the blood in the capillaries and the air in the alveoli.

There are three layers between the blood and the air in the alveoli: the capillary wall, a layer of extracellular matrix and the alveolar wall. This is called the blood-gas barrier.

(a) The extracellular matrix contains collagen.

(i) Describe the structure of collagen.

8 Human papilloma virus (HPV) is a DNA virus.

- (a) Some strains of HPV are sexually transmitted and can cause cervical cancer or genital warts.

The table shows some information about the conditions associated with four strains of HPV.

HPV strain	Condition associated with the strain	Percentage of all cases caused by the strain (%)
6	cervical cancer	<1
	genital warts	67
11	cervical cancer	<1
	genital warts	22
16	cervical cancer	55
	genital warts	<1
18	cervical cancer	13
	genital warts	<1

- (i) Comment on the relationship between HPV and these two conditions.

(c) In agammaglobulinaemia, stem cells in the bone marrow cannot differentiate into B cells.

Agammaglobulinaemia can be a sex-linked condition.

(i) Which of the following describes the production of B cells from bone marrow stem cells?

(1)

- A** from differentiated cells by meiosis
- B** from differentiated cells by mitosis
- C** from undifferentiated cells by meiosis
- D** from undifferentiated cells by mitosis

(ii) State what is meant by the term **sex-linkage**.

10 Scientists have studied behavioural, anatomical and genetic variation in elephants.

The table shows some information about two populations of African elephants.

Population	Location	Feeding behaviour	Anatomical differences
Forest elephant	tropical forest of central and West Africa	feeds on leaves and fruits of high-growing plants such as shrubs and trees	<ul style="list-style-type: none"> • lower jaw longer and narrower • tusks straighter and downward facing • overall a much smaller size
Savannah elephant	African savannah	feeds on grass and leaves of low-growing shrubs	<ul style="list-style-type: none"> • lower jaw shorter and wider • tusks more curved and upward facing • overall a larger size

The photographs show elephants from the two populations.

Forest elephant

Savannah elephant

DNA samples were collected from these two populations of elephants.

- (a) One of the genes showing variation was the GBA gene. The table shows the frequency of the alleles of the GBA gene in the two populations.

GBA allele	Frequency of allele in the elephant population	
	Savannah elephant	Forest elephant
J	0.05	0.43
K	0.00	0.57
L	0.95	0.00

- (i) State what is meant by the term **allele**.

(1)

- (ii) Use the Hardy-Weinberg equation to show that more than 50% of the forest elephant population are homozygous for the GBA gene.

(3)

Answer.....

(b) Scientists have concluded that the forest elephant and the savannah elephant are two different species.

* (i) Analyse the data and the information provided to comment on the validity of this conclusion.
