COMPONENT 2

Biodiversity and Physiology Of Body Systems

SPECIMEN PAPER

1 hour 30 minutes

| For Examiner's use only | | |
|-------------------------|--------------|--------------|
| Question | Maximum Mark | Mark Awarded |
| 1. | 8 | |
| 2. | 20 | |
| 3. | 15 | |
| 4. | 12 | |
| 5. | 11 | |
| 6. | 9 | |
| Total | 75 | |

ADDITIONAL MATERIALS

In addition to this examination paper, you will need a calculator and a ruler.

INSTRUCTIONS TO CANDIDATES

Use black ink or black ball-point pen. Do not use gel pen. Do not use correction fluid.

Write your name, centre number and candidate number in the spaces at the top of this page.

Answer **all** questions.

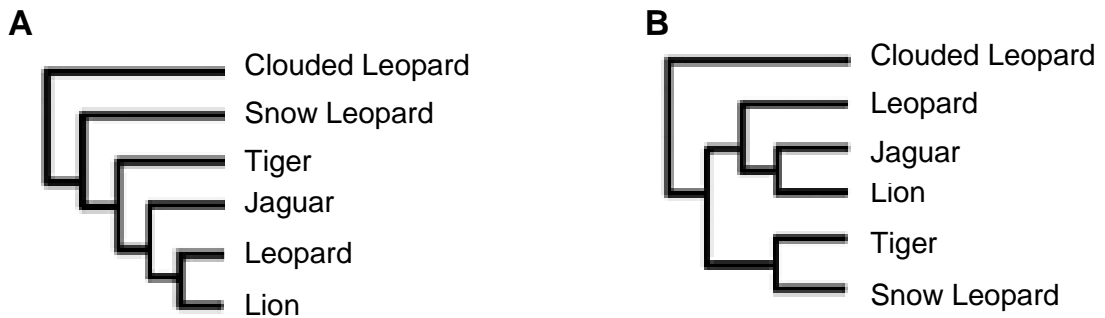

Write your answers in the spaces provided in this booklet.

INFORMATION FOR CANDIDATES

The number of marks is given in brackets at the end of each question or part-question.

The assessment of the quality of extended response (QER) will take place in question 6.

1. Different scientists interpret available scientific evidence in different ways. The models below show possible evolutionary relationships between different species of 'big cat'. Model A is based solely on morphological evidence and model B is based on biochemical analyses.

(a) (i) What name is given to this type of diagram? [1]

.....

(ii) Big cats are classified into the kingdom Animalia. Name the other kingdoms used in the classification of organisms. [2]

.....

(b) The big cats shown in the diagrams above have been given the following scientific names according to the binomial system:

| | |
|-----------------|--------------------------|
| Clouded Leopard | <i>Neofelis nebulosa</i> |
| Leopard | <i>Panthera pardus</i> |
| Lion | <i>Panthera leo</i> |
| Jaguar | <i>Panthera onca</i> |
| Snow Leopard | <i>Uncia uncia</i> |
| Tiger | <i>Panthera tigris</i> |

Based on their scientific names which of the big cats are the **least** closely related to the tiger? Give a reason to support your answer. [2]

.....

- (c) Samples of mitochondrial DNA from a lion, a tiger and a snow leopard were analysed. The base sequences for the same section of their mitochondrial DNA are shown below.

| | | | | | | | | |
|---------------------|------------|----|------------|----|------------|----|------------|----|
| Lion | ATACGTGTAT | 10 | ACGTGTACGT | 20 | GTGTACGTGT | 30 | GTACGTGTGT | 40 |
| Tiger | ACGTGTACGT | | GTGTATACGT | | GTACGTGTGT | | ACGTGTGTAT | |
| Snow Leopard | ATACGTGTAC | | GTGTATACGT | | GTACGTGTGT | | ACGTGTGTAC | |

| Species 1 | Species 2 | Number of bases in common |
|-----------|--------------|---------------------------|
| Lion | Tiger | 20 |
| Tiger | Snow Leopard | 31 |
| Lion | Snow Leopard | 25 |

Based on this information which of the two proposed models is supported by these results? Explain your answer. [1]

.....

.....

.....

- (d) Human mitochondrial DNA codes for proteins essential for some of the reactions which take place within the mitochondrion. Name **two** forms of RNA which are essential for the synthesis of these proteins within the mitochondrial matrix. [2]

.....

2. Plants need water for transport, support and photosynthesis among other biochemical processes. Water uptake from the soil is largely passive and the flow of water from the roots to the leaves is driven in part by the loss of water through the stomata.

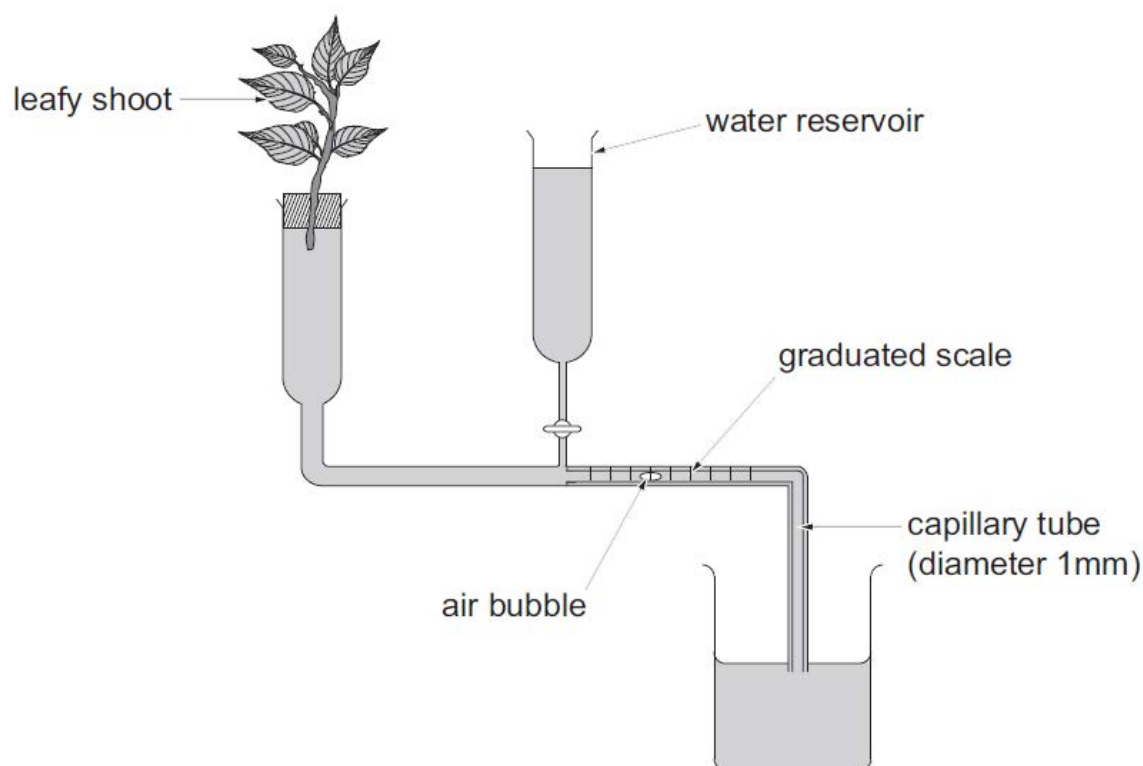

(a) State the name of the process by which plants lose water from their leaves.

[1]

.....

The apparatus shown in the diagram was used to study how wind speed affects the rate at which a leafy shoot takes up water.

The same shoot was exposed to air moving at different speeds. At each speed the distance moved by the air bubble in 5 minutes was recorded. The results were then used to calculate the rate of water uptake by the leafy shoot in $\text{mm}^3 \text{min}^{-1}$.

- (b) The table below shows the results of the investigation.

| | | | | | | |
|--|------|------|------|------|------|-------|
| Wind speed (m s^{-1}) | 0 | 5.0 | 10.0 | 15 | 20 | 25.0 |
| Distance travelled by air bubble in 5 minutes (mm) | 64 | 98 | 129 | 163 | 175 | 151 |
| Rate of water uptake ($\text{mm}^3 \text{min}^{-1}$) | 10.0 | 15.3 | 20.2 | 25.5 | 27.4 | |

- (i) Using the formula below, calculate the rate of water uptake by the plant in $\text{mm}^3 \text{min}^{-1}$ at a wind speed of 25 m s^{-1} . [3]

$$\text{Volume of water} = \text{distance travelled by bubble} \times \pi \times \text{radius}^2 \quad (\pi = 3.14)$$

Answer = $\text{mm}^3 \text{min}^{-1}$

- (ii) Explain why the rate of water uptake increased as the wind speed increased from 0 to 20 m s^{-1} . [3]

.....

.....

.....

.....

AS BIOLOGY Specimen Assessment Materials 28

- (c) The results show, that at a wind speed above 20 m s^{-1} , the rate of water uptake by the leafy shoot decreased. One explanation for this decrease could be due to the closure of the stomata by guard cells.

Describe the role of **each** of the following in the operation of guard cells in **closing** stomata.

- (i) K^+ (potassium ions). [1]

.....

.....

.....

- (ii) Water potential of the cells. [1]

.....

.....

.....

- (iii) Unevenly thickened cell walls. [1]

.....

.....

.....

- (d) Suggest how you could adapt the experimental technique given to determine the location of the highest density of stomata. Predict the results you would expect. [3]

.....

.....

.....

.....

.....

.....

- (e) Many plants are adapted to living in regions of low water availability.
(i) What term is used to describe this type of plant? [1]

-
(ii) The photomicrograph below shows a section through a leaf showing a number of adaptations to living in an arid environment.

Identify three features that can be seen in the photomicrograph and explain how each helps the plant to reduce water loss. [6]

Feature 1:

.....
.....
.....

Feature 2:

3. The mammalian gut is divided into several regions, each adapted to carry out different functions. The conditions in each region are different and parasites that inhabit the gut must be able to adapt to these conditions.

The diagram below shows how the pH of the alimentary canal changes in different regions.

- (a) Explain the cause of the following:
- (i) the increase in pH in region C; [1]

.....

.....

- (ii) the decrease in pH in region D. [2]

.....

.....

- (b) (i) Using letters from the diagram, identify the regions of the human alimentary canal where you would expect to find the tapeworm *Taenia solium* in an infected person. [1]

.....

- (ii) How is the tapeworm adapted to survive in these regions? [2]

.....
.....

- (c) Adult *Taenia solium* usually have about 1 000 proglottids (segments), each of which contains both male and female reproductive systems. A mature proglottid can contain about 50 000 eggs and a mature tapeworm releases an average of six mature proglottids each day. Each tapeworm can survive for about 25 years.

- (i) Suggest why *Taenia solium* needs to produce so many eggs. [1]

.....
.....

- (ii) Estimate the number of eggs that could be produced by a single *Taenia solium* during its lifetime. Show your workings and give your answer in standard form to two significant figures. [3]

Answer eggs

- (d) Explain why both humans and the tapeworm *Taenia solium* are described as being **heterotrophic** but only the human has **holozoic** nutrition. [3]

.....
.....
.....
.....
.....
.....

- (e) The body of an animal, previously unknown to science, was discovered in Papua New Guinea. The passage below describes some of the initial observations made.

“The animal is a mammal approximately 1.2 m long and 0.6 m high. It has sharp upper and lower incisors with well-developed canines; the first premolars are sharp with serrated edges while the rear premolars are similar to the molars and have strong ridges. Total gut length is approximately 15.0m (compared to 30.8 m in a sheep and 5.1 m in a dog of similar size). The ratio of body length to intestine length is 1:13 (compared to 1:25 in a sheep and 1:6 in a dog of similar size).”

What conclusion could be reached about the animal's mode of nutrition?
Give reasons for your answer.

[2]

4. Insects and mammals have both evolved to live in terrestrial environments. One of the main problems they have had to overcome is the absorption of oxygen from the air. To do this both types of organism have evolved internal gas exchange systems.

(a) (i) Name the sites of gas exchange in insects and mammals. [1]

Insects

Mammals

(ii) Explain why insects and mammals have internal gas exchange systems. [2]

.....

.....

.....

.....

The table below compares some facts about gas exchange and oxygen transport in insects and mammals.

| | | Insects | Mammals |
|--|---------------------|-----------|------------|
| % oxygen in air | before gas exchange | 21% | 21% |
| | after gas exchange | 17 – 18% | 13.5 - 16% |
| Surface Area of gas exchange surface : Volume of body tissue | | Very high | High |
| Association with transport system | | None | Close |
| Haemoglobin required | | No | Yes |
| Maximum thickness of body tissue (approximate value) | | 20 mm | no limit |

(b) Use the information above to evaluate the following statement:
 ‘The size and shape of insects is limited but that of mammals is not.’ [4]

.....

.....

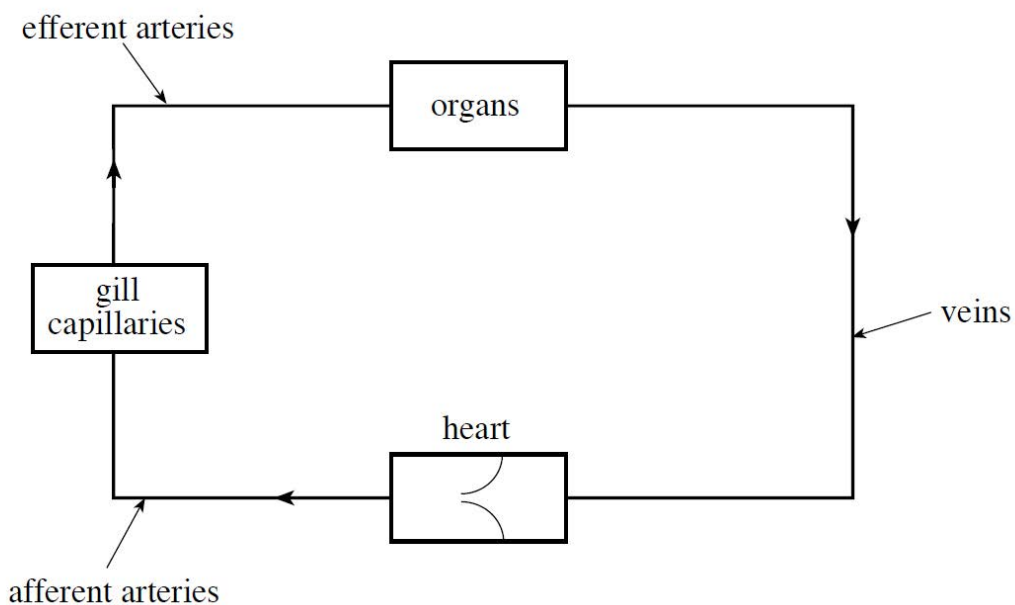

.....

.....

.....

.....

The diagram below represents the circulatory system of a fish.

- (c) Name the type of circulatory system. [1]

.....

- (d) Fish have evolved gills that allow gas exchange. Water contains approximately 1% dissolved oxygen but fish are able to absorb about 80% of the available oxygen and remain highly active.

Describe how the structure of their gills enables bony fish to be so efficient at gas exchange. [4]

5. In recent years scientists have become increasingly concerned about the global decrease in **biodiversity**. A higher than normal rate of **extinction** caused by humans has been proposed as the main reason for this decrease. In the UK, hedges have been identified as being habitats that have a high biodiversity.

- (a) State what is meant by the terms: [2]

biodiversity

.....

.....

extinction

.....

.....

- (b) To assess the change in biodiversity the presence of some types of plant growing in a 100 m length of hedge was surveyed in 2000 and again in 2010. Each of these species provide a source of food for a wide variety of animals.

A diversity index was calculated based on the results. These are shown in the table below.

| Species (description) | Number of plants present per species | |
|--|---|------|
| | 2000 | 2010 |
| Hawthorn dense structure; fairly slow growing; grows to 5 – 14m tall | 37 | 8 |
| Hazel open structure; grows to 4 – 8 m tall; grows many shoots directly from the roots | 21 | 10 |
| Ivy a climbing plant that covers the ground and grows up other plants to get light | 36 | 41 |
| Elder fast growing shrub usually between 3 and 8 m tall | 12 | 50 |
| Bramble produces long stems but usually does not exceed 2 m in height | 61 | 12 |
| DIVERSITY INDEX | | 0.60 |

- (i) Using the formula and the table given below, calculate the Diversity Index for the year 2000 data. [3]

$$\text{Diversity Index} = 1 - \frac{\sum n(n-1)}{N(N-1)}$$

Where: N = total number of individual plants
 n = number of individuals per species
 Σ = sum of

| Species | n | $(n-1)$ | $n(n-1)$ |
|----------|---------|---------|-----------------|
| Hawthorn | 37 | | |
| Hazel | 21 | | |
| Ivy | 36 | | |
| Elder | 12 | | |
| Bramble | 61 | | |
| | $N =$ | | $\sum n(n-1) =$ |
| | $N-1 =$ | | |

$N(N-1) =$ _____

Diversity Index = _____

- (ii) Many hedges are being removed each year and many are not being maintained as hedges, but are turning into lines of trees with a corresponding change in the biodiversity of the habitat. Using the information given and the values for the Diversity Index, what conclusions can be made about the change in biodiversity in this hedge? Suggest an explanation for this change. [3]
