The diagram below shows a vertical section through a leaf as seen under a light microscope.

(a) Name the parts A, B & C.	
A:	[1]
B:	[1]
C:	[1]
(b) In which part would you find most chloroplasts?	
	[1]
(c) The diagram below shows the electron microscope features of a chloroplast.	

(1)	Name structures 1 to 6.			
	1:	2:	3:	
	4:	5:	6:	 [6]
(ii)	What reaction of photosynthesis	occurs in,		
	1. Structure 4:			••••
	2. Structure 2:			 [2]

The graph below shows the effect of light intensity on photosynthesis.

(a)	What is the limiting factor in region X?	
(b)	What is being demonstrated at Y & Z?	[1
		 [3

(c)Draw a simple apparatus that you could use to investigate the effect of light intensity on an aquatic plant such as Canadian Pondweed (Elodea canadiensis).

[3]

The diagram below shows the ultrastructure of a chloroplast.

- (a) On the diagram, label
 - (i) the site of the light dependent reaction of photosynthesis.
 - (ii) a site of the light independent reaction of photosynthesis.
 - (iii) a site of food storage.

L	_

independent stage of photosynthesis (Calvin cy the ¹⁴ C?	which intermediate compound would be the first to contain
	[1]
(c) Name three chloroplast pigments.	
1	
2	
3	
	[3]

The graph below shows the effect of temperature on the rate of photosynthesis in two plants, A and B.

A:	
B:	[2]
(b) Which plant is likely to grow better in a cool, temperate region? Give a reason for your answer.	
	[2]
(c) Why does photosynthesis stop at high temperatures?	
	[1]
(d) Name two environmental factors other than temperature which limit the rate of photosynthesis.	
1:	

[2]

QUESTIONSHEET 5

The table below shows the results of an experiment in which the effect of different light intensities on the rate of photosynthesis of Canadian Pondweed was measured at two different carbon dioxide tensions. Sodium hydrogen carbonate was used as a $\rm CO_2$ source. The different light intensities were obtained by placing a 60 watt lamp at different distances from the plant in a darkened room. The rate of oxygen evolution was measured as an indicator of photosynthetic rate.

Distance of lamp from plant/metres	2.00	1.50	1.00	0.75	0.50	0.25	0.10
Rate of O ₂ release in 1% HCO ₃ /mm ³ min ⁻¹ A	0.2	0.4	0.7	1.4	1.4	1.4	1.4
Rate of O ₂ release in 2% HCO ₃ ⁻ /mm ³ min ⁻¹ B	0.6	0.8	1.1	1.5	1.8	1.8	1.8

(a) Plot	the results on graph paper. [5]
(b) (i)	Describe the relationship between light intensity and the rate of photosynthesis using curve B from your graph.
••••	[3]
(ii)	Comment on the differences shown in the rates of photosynthesis in A and B.
(c) The	light intensity [I] at the plant is given by the formula: $I \approx \frac{1}{d^2}$ are d is the distance of the light source from the plant.
	culate the light intensities in A and B at which the rate of photosynthesis starts to be limited. Show your king.
	Answer A: Answer B:

Do not write in margin

QUESTIONSHEET 6

The diagram below shows part of the light independent reaction of photosynthesis.

RuBP ——	A	\longrightarrow	GP	$\xrightarrow{ B }$	Glucose	> Starch
				C		

Č	
(a) Identify compounds A, B and C.	
A:	[1]
B:	[1]
C:	[1]
(b) Where in the chloroplast does this reaction take place?	
	[1]
(c) Apart from being converted to glucose, what other use has GP?	
	[1]
(d) State the source of compounds B and C in the photosynthetic process.	
(e) How is glucose converted to starch?	[2]

[2]

The table below shows the results of an experiment on the production and use of sugars in the leaves of a plant.

	RATE OF SUGAR PRODUCTION/USE /arbitrary units							
TEMPERATURE/°C	Photosynthesis (high light intensity)	Respiration	Net gain/loss					
0	0	2						
10	36	4						
15	42	5						
20	72	6						
25	80	8						
30	48	16						
40	12	30						
50	0	20						
60	0	18						

(a) (i)	From these figures work out the net gain/loss of sugar at each temperature and write the figures in appropriate box on the table.	the
		[2]
(ii)	Plot the results of sugar production in photosynthesis, sugar use in respiration and net gain/loss at different temperatures, graphically.	rent
		[5]
(b) Wha	at are the optimum temperatures for,	
(i)	photosynthesis:	
(ii)	respiration?	[2]
(c) (i)	Define the term 'compensation point'.	
••••		•••••
••••		[2]
(ii)	Use the graph to estimate the temperature at which the plant reaches its compensation point.	
		[1]

QUESTIONSHEET 8

The graph below shows the effect of oxygen concentration on the rate of photosynthesis.

(a) Comment on the effect of oxygen concentration on photosynthesis.

The graph below shows the effect of changing the carbon dioxide concentration on the rate of photosynthesis.

b) What conclusions can you draw from this graph?
[4]
e) (i) Define the term "compensation point".
[2]
(ii) Describe what happens when the compensation point is exceeded.
[2]
(iii) Explain why it is of advantage for a woodland herb to have a low compensation point.

QUESTIONSHEET 10

The experiment below is designed to show that sunlight is necessary for photosynthesis.

The plant is destarched by leaving it in the dark for 48 hours prior to the investigation. It is then left in the sunlight for at least 5 hours.

(a) (i)	Why is the plant destarched first?	
••••		[2]
(ii) 	Why does the plant destarch in the dark?	
••••		[2]
	wo leaves, A & B, are detached and tested for starch after 5 hours. Explain how you would test aves for starch.	t the two
••••		
••••		[5]
(c) Des	escribe the expected results of the two leaves after testing for starch.	
••••		
		[3]

The diagram shows the biochemical processes taking place in two plant cell organelles:

(a) Name organelles X and Y and substances A and B.
X:[1]
Y:[1]
A:[1]
B:[1]
(b) Oxidative phosphorylation occurs in organelle Y and photophosphorylation occurs in organelle X. Outline the difference between oxidative phosphorylation and photophosphorylation.
[6]

(c) (i) The light reaction produces ATP and NADPH, which are used in the dark reaction. What are they used for in the dark reaction?

(ii) State two uses of ATP produced in plants.

QUESTIONSHEET 12

Read through the following account of photosynthesis and then complete it by inserting the most appropriate word or words into the spaces.

There are three pigments commonly found in the chloroplasts of flowering plants. These are chlorophyll a,
chlorophyll b and
wavelengths of light. During cyclic photophosporylation the absorption of light causes the displacement of an
electron from the chlorophyll molecule. This electron is returned to the chlorophyll via a series of
which are at progressively lower energy levels. Coupled with this electron flow is the synthesis of
This compound is then used in the light independent reaction which occurs in the
region of the chloroplast. During non-cyclic photophosphorylation, the electron is combined with
ions resulting from the photolysis of to form the reduced coenzyme called
This reduced coenzyme is used in the cycle to convert
acid to phosphoglyceraldehyde (PGAL). This can be converted to which is the
acceptor molecule for the carbon dioxide used in photosynthesis. The electron emitted from the chlorophyll
molecule is replaced by electrons from the ions produced by photolysis.
As a result gas is liberated.
[14]
(b) Explain why plants need a healthy root system to photosynthesise.
[2]

QUESTIONSHEET 13

Suggest explanations for each of the following:

(a) Leaves in the tops of beech trees have two or three layers of palisade mesophyll cells, but the leadown only have one layer of palisade mesophyll cells.	aves lower
	[3]
(b) Peas and beans tend to contain much higher concentrations of protein than cereals.	
	•••••
	[2]
(c) Power stations frequently have adjacent man-made lakes containing algae, such as Chlorella.	
	[3]

The graph below shows results of investigations into the mechanism of stomatal opening.

(a) De	escribe the relationship between stomatal aperture width and starch concentration between:
(i)	8.00 am and noon.
	[1]
(ii)	4.00 pm and 8.00 pm.
	[1]
(b) (i)	Using information from the graph and your own knowledge, suggest a mechanism for stomatal opening.
	[4]
(ii)	
•••	
	[2]
(c) De	escribe one technique which can be used to measure the stomatal density on the underside of a leaf.
•••	
•••	

A drop of water containing a strand of the green algae, *Spirogyra*, and some free living aerobic bacteria were mounted on a microscope slide. The slide was then illuminated with light which was split into its constituent colours (wavelengths) using a prism. The figure shows the distribution of bacteria after a few minutes.

(a) Describe the distribution of bacteria.	
	[1]
(b) Suggest an explanation for the distribution of bacteria.	
	[3]
(c) Chloroplasts contain several pigments. What is the significance of this in photosynthesis?	
	•••••
	[3]
