- 1 Knowledge of the nitrogen cycle can be used to make decisions about management of farmland. A farmer uses her grass meadow to raise sheep. In a separate field she grows cabbages.
 - (a) Fig. 1.1 shows part of the nitrogen cycle. The four boxes on the bottom line of the diagram refer to substances in the soil.

Fig. 1.1

| ์ Sเ | re sneep on this farm belong to a rare breed called Greylace Dartmoor. The Rare Breeds urvival Trust (RBST) gives advice on looking after these sheep and keep records to monitor be breeding of these sheep, in order to maintain a healthy population. |
|---------|--|
| W | hy is the continued existence of rare breeds of farm animals desirable? |
| | |
| | |
| | |
| | [2] |
| sh m | orth Ronaldsay sheep are listed as 'endangered' by the Rare Breeds Survival Trust. These leep were raised on a small Scottish Island where they were kept along the seashore for lost of the year. The sheep developed an unusual metabolism that allowed them to survive reating seaweed. They are, however, susceptible to copper poisoning when fed on grass. |
| (i) | metabolism, such as the ability to eat mainly seaweed. |
| | [2] |
| (ii) | Suggest what particular problems make the North Ronaldsay breed one of the most endangered sheep breeds in the United Kingdom. |

- 2 Total plant growth within an ecosystem depends on the light intensity, temperature and the supply of water and inorganic minerals to the ecosystem.
 - Table 3.1 shows the net primary production by plants in four different ecosystems.

Table 3.1

| ecosystem | net primary production (kJ m ⁻² year ⁻¹) |
|---------------------|--|
| temperate grassland | 9240 |
| temperate woodland | 11 340 |
| tropical grassland | 13440 |
| tropical rainforest | 36 160 |

| ` , | Discuss possible reasons for the differences in net primary production in these ecosystems. |
|-----|---|
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | F.A' |

| (b) | To calculate the net primary production figures in Table 3.1 in kJ m ⁻² year ⁻¹ , it is necessary to measure the energy content of the primary producers. | | | | | |
|-----|---|--|--|--|--|--|
| | Outline how the energy content, in kJ, of a primary producer such as grass can be measured in the laboratory. | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | [2] | | | | | |
| (c) | The efficiency with which consumers convert the food they eat into their own biomass is generally low. | | | | | |

Table 3.2 compares the energy egested, absorbed and respired in four types of animal.

Table 3.2

| | percentage of energy consumed that is: | | | |
|--------------------------------------|--|----------|----------|----------------------|
| animal | egested | absorbed | respired | converted to biomass |
| grasshopper, a herbivorous insect | 63 | 37 | 24 | 13 |
| perch, a carnivorous fish | 17 | 83 | 61 | |
| cow, a herbivorous mammal | 60 | 40 | 39 | |
| bobcat, a carnivorous mammal | 17 | 83 | 77 | 6 |

(i) Complete Table 3.2 to show the percentage of energy consumed that is converted into biomass in the perch and the cow.

[Total: 8]

| 4 | | barb, <i>Rheum x hybridum</i> , is a plant that is grown for its edible stems. In Spring, the stems and es grow from fleshy roots which survive the Winter underground. |
|---|-------|---|
| | | wers have developed many new varieties of rhubarb by growing plants from seed, choosing best young plants and then asexually reproducing them. |
| | varia | ds are produced by sexual reproduction and the rhubarb plants that grow from seed show ation in characteristics such as stem colour, dormancy period and the concentration of oxalic in their leaves. |
| | (a) | Outline the events that lead to genetic variation in gametes and in the plants grown from seed. |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |

| (b) | rhuk larg | litionally, rhubarb plants have been produced by vegetative propagation. The best young parb plants are allowed to grow for three seasons until their underground root systems are e enough. They are then dug up in Winter, the roots are cut into pieces and the pieces replanted. Each piece is then able to grow into a new rhubarb plant that is identical to the ent. |
|-----|--------------|---|
| | (i) | State the biotechnological term for this type of vegetative propagation. |
| | | [2] |
| | (ii) | A gardener wished to multiply his rhubarb plants using the traditional method, but he discovered that his plants were infected by a virus. |
| | | Name the modern technique which allows commercial growers to produce large numbers of genetically identical plants that are also virus-free. |
| | | [1] |
| | (iii) | Rhubarb plants must spend seven to nine weeks at a temperature below 3 °C in order to break their winter dormancy and allow them to start growing stems and leaves again. |
| | | The length of the cold period that is required depends on the variety of rhubarb. |
| | | In the variety 'Timperley Early', the length of the cold period is shorter, so the plants grow and produce a crop earlier in the year than the variety 'Victoria'. |
| | | Suggest two ways in which the varieties may differ from one another biochemically to account for the difference in the length of the cold period required by each. |
| | | |
| | | |
| | | |
| | | [2] |

- **(c)** Rhubarb leaves contain oxalic acid, a relatively strong acid which is soluble in water and alcohol. High concentrations of oxalic acid makes rhubarb leaves poisonous to humans and other animals.
 - (i) The amount of oxalic acid in the leaves varies according to the variety of rhubarb, the age of the plant and environmental factors.

Suggest and plan an experiment to compare how the variety of rhubarb affects the amount of oxalic acid in rhubarb leaves.

Include in your plan:

- the variables that you could control
- an outline of the experimental procedure you would use
- any measurements that you would make.

| In your answer you should make clear which are the independent, dependent and controlled variables. |
