## QUESTIONSHEET 1

(a) (double helix) of DNA unravels to form two single stranded (primer) DNA molecules;
these attract complementary (energy rich) nucleotides/nucleoside triphosphates (to primer strands);
these join to (primer) strands forming daughter DNA;
under influence of DNA polymerase;
bases join by hydrogen bonds between complementary pairs;
and adjacent sugars join by phosphate bridges;
(b) 2 (arbitrary) units;
(c) chromatids separate to poles;
during anaphase;
nuclear membranes then reform around two daughter nuclei;
each containing the diploid number of chromosomes;
$\max 3$
(d) 1 (arbitrary) unit;

## QUESTIONSHEET 2

(a) (i) quality; correct chromosomes; (could have two X chromosomes)

(ii) quality; correct chromosomes;

(For quality marks, lines should be clear and joined up properly.
For chromosome mark, chromosomes should be clearly reognisable/correct shape).
(b) Male; two chromosomes did not match/ref sex chromosome/X and Y;

## QUESTIONSHEET 3

(a) (i) 9 ;
(ii) 36 ;
(iii) 36 ;
(iv) 18 ;
(v) 9 ;
(b) female nucleus $=9+$ male nucleus $=9=18$;
(c) chromosomes of cabbage and radish differ structurally; thus bivalents could not form and meiosis/gamete production would fail;

## QUESTIONSHEET 4

(a) (i) mitosis;
(ii) mitosis;
(iii) mitosis and meiosis;
(iv) mitosis and meiosis;
(v) meiosis;
(b) germination of haploid spores to form gametophyte in mosses/liverworts; growth of the haploid gametophyte in mosses/liverworts/growth of fern gametophyte; /production of haploid gametes in fern gametophyte;

## QUESTIONSHEET 5

(a) (i) anaphase;
(ii) telophase;
(iii) metaphase;
(iv) prophase;
(b) (i) 20 units;
(ii) 10 units;

## QUESTIONSHEET 6

(a) A: pole/aster/centrosome;
B: chromosome;
C. spindle;
(b) (i) prophase; 1
(ii) anaphase;
(c) metaphase; 1
(d) root/shoot tip;
vascular cambium;
cork cambium;

## QUESTIONSHEET 7

(a) chromosomes replicate into chromatids (except at the centromere);

DNA deposits on chromosomes (making them stainable/visible);
chromosomes condense/become shorter/fatter;
chromosomes become attached to spindle;
chromosomes complete replication (at centromere);
one set migrates to one pole and the other set to the other pole;
chromosomes revert to interphase condition/long and thin/unstainble/lose DNA;
allow one mark if sequence is correct;
$\max 5$
(b) (i) telophase;
(ii) cell plate/phragmoplast forms;
involves vesicles from Golgi complex;
cell wall forms;
spindle disintegrates; $\boldsymbol{\operatorname { m a x } 2}$

## QUESTIONSHEET 8

(a) (i) point where sister chromatids join;
position is constant;
point of attachment to spindle;
chromatids unable to separate without centromere/drawn apart at centromeres (by spindle);
(ii) composed of microtubules/tubulin;
spindle fibres shorten during anaphase;
pull sister chromatids apart;
$\max 2$
(b) produces haploid cells from diploid cells;
so preserving diploid state when gametes fuse;
random assortment gives genetic variation;
chiasmata give genetic variation; $\boldsymbol{\operatorname { m a x } 2}$

## QUESTIONSHEET 9

(a) replication of chromosomes occurs;
in the $S$ phase;
synthesis of proteins occurs;
synthesis of rRNA/mRNA/tRNA occurs;
cell organelles are produced;
cell carries out all its (metabolic) functions;
$\max 3$
(b) A: prophase;

C: anaphase;
E cytokinesis;
F: interphase;

## QUESTIONSHEET 10

(a)

| Stage | Description |
| :--- | :--- |
| Prophase | chromosomes become shorter and thicker; |
| Metaphase | chromosomes attach to spindle ends at equator; |
| Anaphase | daughter chromosomes move to the poles; |
| Telophase | nuclear membranes reappear; |
| Interphase | chromosomes replicate except at their centromeres; |
| Cytokinesis | division of the cytoplasm occurs; |

(b) (in animals) cytoplasm divides by constriction (between daughter nuclei);
(in plants) a phragmoplast/cell plate/new cell wall is synthesised (between the daughter nuclei);

## QUESTIONSHEET 11

(a) spindles formed from centrosomes/centrioles;
(daughter/replicated) chromosomes migrating to the poles;
pulled by contracting spindles;
which are attached to the centromeres;
one set of chromosomes goes to one pole and other set to the other pole;
(b) (i) and (ii)

Drawing:
4 chromosomes not yet replicated;
attached to spindles by their centromeres;
same chromatid length/centromere positions as in anaphase drawing;
centrosome/aster;

## QUESTIONSHEET 12

(a) meristems; buds/intercalary meristems; allometric; $\mathrm{S} ; \mathrm{G}_{2} ;$ prophase; chromatids;
centromere; 40/20 pairs; 20/10 pairs; diploid; 20;
(b) can secrete/release colchicine into surrounding soil;
where it can inhibit mitosis/root growth of nearby plants/inhibit seed germination;
thus reducing competition from other plants;
ref to Autumn Crocus being an 'aggressive' plant;
