

AQA Biology GCSE

5.1 - Homeostasis

Flashcards

What is homeostasis?

What is homeostasis?

Homeostasis is the maintenance of a constant internal environment in order to maintain optimum conditions for enzyme and cellular function.

Give examples of conditions maintained by homeostasis in the body

Give examples of conditions maintained by homeostasis in the body

- Blood glucose concentration
- Body temperature
- Water levels

What two types of responses are used in body control systems?

What two types of responses are used in body control systems?

Nervous and chemical

What three components do all control systems have?

What three components do all control systems have?

- Receptors
- Coordination centres
- Effectors

What is the function of a receptor?

What is the function of a receptor?

Receptors detect changes in the environment (stimuli).

What is the function of a coordination centre?

What is the function of a coordination centre?

Coordination centres obtain and process information from receptors.

What is the function of an effector?

What is the function of an effector?

Effectors (muscles or glands) bring about responses to stimuli.
