6 (b)	 An internet article states: Mosquito larvae are at the start of the food chain for some fish. Adult mosquitoes provide food for bats and birds. Mosquitoes are also important in plant reproduction because they feed from flowers of crop plants.
6 (b) (i)	The first sentence in the article is not correct.
	Explain why. [2 marks]
6 (b) (ii)	A company plans to produce genetically modified (GM) adult male mosquitoes. The GM mosquitoes will carry a gene from bacteria. The gene causes the death of offspring before they become adults.
	Male mosquitoes do not feed on blood. Scientists are considering releasing millions of adult male GM mosquitoes into the wild.
	Do you think scientists should release millions of male GM mosquitoes into the wild?
	In your answer you should give advantages and disadvantages of releasing
	GM mosquitoes into the wild. [4 marks]

Students investigated a food chain in a garden.

lettuce → snail → thrush (bird)

The students:

7

- estimated the number of lettuce plants in the garden
- estimated the number of snails feeding on the lettuces
- counted two thrushes in the garden in 5 hours.

 Table 2 shows the students' results and calculations.

Organism	Population size	Mean mass of each organism in g	Biomass of population in g	Biomass from previous organism that is lost in g	Percentage of biomass lost
Lettuce	50	120.0	6000		
Snail	200	2.5	500	5500	91
Thrush	2	85.0	170	330	66

Table 2

7 (a) (i) Give two ways that biomass is lost along a food chain.

[2 marks]

7 (a) (ii) Scientists estimate that about 90% of the biomass in food is lost at each step in a food chain.

Suggest **one** reason why the students' value for the percentage of biomass lost between the snails and the thrushes is only 66%.
