(b) The diagram shows a different way to obtain cows that produce high milk yields. The process is called embryo cloning.

In this process individual cells from an embryo known to have the potential to become a high milk yielding cow are separated before they become specialised. Each separated cell is then allowed to develop into a new embryo. These new embryos are then put into surrogate mothers.

(i) Where in the body of the surrogate mothers do the new embryos develop?

(1)

(ii) Suggest three advantages of producing cows with desirable characteristics using embryo cloning rather than using selective breeding.
