## BUFFER SOLUTIONS - INTRODUCTION AND USES

Definition
"Solutions which resist changes in pH when small quantities of acid or alkali are added."

Types Acidic Buffer $(\mathrm{pH}<7) \quad$ weak acid + its sodium or potassium salt ethanoic acid sodium ethanoate

Alkaline Buffer ( $\mathrm{pH}>7$ )
weak base + its chloride
ammonia ammonium chloride

Biological

Uses

Blood

In biological systems (saliva, stomach, and blood) it is essential that the pH stays 'constant' in order for any processes to work properly. Most enzymes work best at particular pH values.

- the pH of blood is normally about 7.4
- If the pH varies by 0.5 it can lead to unconsciousness and coma
- carbon dioxide produced by respiration can increase the acidity of blood by forming $\mathrm{H}+$ ions in aqueous solution

$$
\mathbf{C O}_{2}(\mathrm{aq})+\mathbf{H}_{2} \mathbf{O}(\mathrm{aq}) \rightleftharpoons \mathbf{H}^{+}(\mathrm{aq})+\mathbf{H C O}_{3}^{-}(\mathrm{aq})
$$

- the presence of hydrogencarbonate ions in blood removes excess $\mathrm{H}^{+}$

$$
\mathbf{H}^{+}(\mathrm{aq})+\mathbf{H C O}_{3}^{-}(\mathrm{aq}) \rightleftharpoons \mathbf{H}_{2} \mathbf{C O}_{3}(\mathrm{aq}) \text { (equivalent to } \mathrm{CO}_{2} \text { in water) }
$$

## Other

Uses
Many household and cosmetic products need to control their pH values.
Shampoo Counteract the alkalinity of the soap and prevent irritation

Baby lotion Maintain a pH of about 6 to prevent bacteria multiplying

Others Washing powder

Eye drops

Fizzy lemonade

## BUFFER SOLUTIONS - ACTION

Acid buffer It is essential to have a weak acid for an equilibrium to be present so that ions can be removed and produced. The dissociation is small and there are few ions.

A strong acid can't be used as it is fully dissociated and cannot remove $\mathbf{H}^{+}(\mathrm{aq})$

$$
\mathrm{HCl}(\mathrm{aq}) \longrightarrow \mathrm{Cl}^{-}(\mathrm{aq}) \quad+\mathrm{H}^{+}(\mathrm{aq})
$$

Adding acid Any $\mathrm{H}^{+}$is removed by reacting with $\mathrm{CH}_{3} \mathrm{COO}^{-}$ions to form $\mathrm{CH}_{3} \mathrm{COOH}$ via the equilibrium. Unfortunately, the concentration of $\mathrm{CH}_{3} \mathrm{COO}^{-}$is small and only a few $\mathrm{H}^{+}$can be "mopped up". A much larger concentration of $\mathrm{CH}_{3} \mathrm{COO}^{-}$is required.

To build up the concentration of $\mathrm{CH}_{3} \mathrm{COO}^{-}$ions, sodium ethanoate is added.

Adding alkali Adds $\mathrm{OH}^{-}$ions. Although they do not appear in the equation, they react with $\mathrm{H}^{+}$

$$
\mathbf{H}^{+}(\mathrm{aq})+\mathrm{OH}^{-}(\mathrm{aq}) \rightleftharpoons \mathbf{H}_{2} \mathbf{O}(\mathrm{aq})
$$

Removal of $\mathrm{H}^{+}$from the weak acid equilibrium means that, according to Le Chatelier's Principle, more $\mathrm{CH}_{3} \mathrm{COOH}$ will dissociate to form ions to replace those being removed.

$$
\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq}) \rightleftharpoons \mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})+\mathrm{H}^{+}(\mathrm{aq})
$$

As the added $\mathrm{OH}^{-}$ions remove the $\mathrm{H}^{+}$from the weak acid system, the equilibrium moves to the right to produce more $\mathrm{H}^{+}$ions. Obviously, there must be a large concentration of undissociated acid molecules to be available.

Other The concentration of a buffer solution is also important If the concentration is too low, there won't be enough $\mathrm{CH}_{3} \mathrm{COOH}$ and $\mathrm{CH}_{3} \mathrm{COO}^{-}$ to cope with the ions added.

Summary For an acidic buffer solution one needs ...
large $\left[\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})\right]$ - for dissociating into $\mathrm{H}^{+}(\mathrm{aq})$ when alkali is added large $\left[\mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})\right]$ - for removing $\mathrm{H}^{+}(\mathrm{aq})$ as it is added

This can't exist if only acid is present so a mixture of the acid and salt is used.
The weak acid provides the equilibrium and the large $\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq})$ concentration. The sodium salt provides the large $\mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})$ concentration.
$\therefore$ One uses a WEAK ACID + its SODIUM OR POTASSIUM SALT

## CALCULATING THE pH OF AN ACIDIC BUFFER SOLUTION

Example 1 Calculate the pH of a buffer solution whose [HA] is $0.1 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ and [A-] of $0.1 \mathrm{~mol} \mathrm{dm}^{-3}$. Assume the $K_{a}$ of the weak acid HA is $2 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}$.

$$
K_{a}=\frac{\left[H^{+}{ }_{(a q)}\right]\left[A_{(a q)}^{-}\right]}{\left[H A_{(a q)}\right]}
$$

re-arranging

$$
\begin{gathered}
{\left[H^{+}{ }_{(a q)}\right]=\frac{\left[H A_{(a q))}\right] K_{a}}{\left[A_{(a q)}^{-}\right]}=\frac{0.1 \times 2 \times 10^{-4}}{0.1}=2 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}} \\
\therefore \quad p H=-\log _{10}\left[\mathrm{H}^{+}{ }_{(a q)}\right]=3.699 \text { (3.7) }
\end{gathered}
$$

Example 2 Calculate the pH when $500 \mathrm{~cm}^{3}$ of $0.10 \mathrm{~mol} \mathrm{dm}^{-3}$ of weak acid HX is mixed with $500 \mathrm{~cm}^{3}$ of a $0.20 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of its salt NaX . $K_{a}=4.0 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3}$.

$$
K_{a}=\frac{\left[H^{+}{ }_{(a q)}\right]\left[X_{(a q)}^{-}\right]}{\left[H X_{(a q)}\right]}
$$

re-arranging $\left[H^{+}{ }_{(a q)}\right]=\frac{\left[H X_{(a q)}\right] K_{a}}{\left[X_{(a q)}^{-}\right]}$

The solutions have been mixed; volume is now $1 \mathrm{dm}^{3}[\mathrm{HX}]=0.05 \mathrm{~mol} \mathrm{dm}^{-3}$ $\left[X^{-}\right]=0.10 \mathrm{~mol} \mathrm{dm}^{-3}$

$$
\begin{align*}
& \therefore\left[{H^{+}}^{(a q))}\right]=\frac{0.05 \times 4.0 \times 10^{-5}}{0.1}=2.0 \times 10^{-5} \mathrm{~mol} \mathrm{dm}^{-3} \\
& \therefore \quad \mathrm{pH}=-\log _{10}\left[\mathrm{H}^{+}(\mathrm{aq})\right]=4.699(4.7) \tag{4.7}
\end{align*}
$$

Alkaline buffer Similar but is based on the equilibrium surrounding a weak base.

|  | $\mathrm{NH}_{3}(\mathrm{aq})$ |
| :--- | :--- |
| relative concs. | HIGH | $\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}(\mathrm{aq}) \rightleftharpoons \mathrm{OH}^{-}(\mathrm{aq}) \quad+\quad \mathrm{NH}_{4}{ }^{+}(\mathrm{aq})$

but one needs ; a large conc. of $\mathrm{OH}^{-}(\mathrm{aq})$ to react with any $\mathrm{H}^{+}(\mathrm{aq})$ added a large conc of $\mathrm{NH}_{4}{ }^{+}(\mathrm{aq})$ to react with any $\mathrm{OH}^{-}(\mathrm{aq})$ added

There is enough $\mathrm{NH}_{3}$ to act as a source of $\mathrm{OH}^{-}$but one needs to increase the concentration of ammonium ions by adding an ammonium salt.

Use AMMONIA (a weak base) + AMMONIUM CHLORIDE (one of its salts)
