# Edexcel Chemistry A-level Topic 10 - Equilibrium I 

Flashcards

Define the term: dynamic equilibrium.

## Define the term dynamic equilibrium.

The rate of the forward reaction is equal to the rate of the reverse reaction.
(Hence, the concentrations of reactants and products do not change.)

## Give an essential condition for an equilibrium mixture.

## Give an essential condition for an equilibrium mixture.

- Equilibrium occurs in a closed system where reactants and products cannot escape.

## OR

- Macroscopic properties do not change with time.

## State Le Chatelier's

 principle.State Le Chatelier's principle.
If a system at equilibrium is altered, the position of equilibrium moves in the direction that reduces the effect of the initial change.

In the equation:

$$
\mathrm{CH}_{4(\mathrm{~g})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \rightleftharpoons \mathrm{CO}_{(\mathrm{g})}+3 \mathrm{H}_{2(\mathrm{~g})}
$$

What effect would increasing the temperature have on the position of equilibrium?

What effect would increasing the temperature have on the position of equilibrium? In the equation: $\mathrm{CH}_{4(\mathrm{~g})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \rightleftharpoons \mathrm{CO}_{(\mathrm{g})}+3 \mathrm{H}_{2(\mathrm{~g}) \Delta H^{\circ}=+210 \mathrm{~kJ} \mathrm{~mol}}$

## The equilibrium position shifts to

 the right.(This is because the forward reaction is endothermic shown by the $+\mathrm{ve} \Delta \mathrm{H}$ value.)

In the equation:
$\Delta H^{\circ}=+210 \mathrm{~kJ} \mathrm{~mol}$
$\mathrm{CH}_{4(\mathrm{~g})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \rightleftharpoons \mathrm{CO}_{(\mathrm{g})}+$
$3 \mathrm{H}_{2(g)}$
What effect would increasing the pressure have on the position of equilibrium?

What effect would increasing the pressure have on the position of equilibrium? In the equation: $\mathrm{CH}_{4(\mathrm{~g})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \rightleftharpoons \mathrm{CO}_{(\mathrm{g})}+3 \mathrm{H}_{2(\mathrm{~g}) \Delta \mathrm{H}^{\circ}+220 \mathrm{~kJ} \mathrm{~mol}}$

## The equilibrium position shifts to the left.

(This is because the rhs of the equation has more moles of gas than the lhs. The side with fewer moles is favoured.)

Consider the reaction:

$$
\Delta \mathrm{H}^{\circ}=+210 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

$$
\mathrm{CH}_{4(\mathrm{~g})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \rightleftharpoons \mathrm{CO}_{(\mathrm{g})}+3 \mathrm{H}_{2(\mathrm{~g})}
$$

Suggest and explain why an industrial chemist may use a high pressure for this production of hydrogen from the above reaction?

Suggest and explain why an industrial chemist may use a high pressure for the production of hydrogen from: $\mathrm{CH}_{4(\mathrm{~g})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \rightleftharpoons \mathrm{CO}_{(\mathrm{g})}+3 \mathrm{H}_{2(\mathrm{~g}) \Delta H^{\circ}=+210 \mathrm{~kJ} \mathrm{~mol}}{ }^{-1}$

1. The high pressure increases the collision frequency, increasing the rate of reaction.
2. This is a compromise pressure between an economically viable rate of reaction and a slightly lower yield of hydrogen from the equilibrium reaction.

## What effect does a catalyst have on the position of equilibrium?

## What effect does a catalyst have on the position of equilibrium?

## No effect.

(This is because a catalyst affects rate of forward and reverse reactions equally rsulting in no overall effect.)

## What condition affects the value of $\mathrm{K}_{\mathrm{c}}$ ?

## $\square$ Concentration

$\square$ Catalyst
$\square$ Pressure
$\square$ Temperature

## What condition affects the value of $\mathrm{K}_{\mathrm{c}}$ ?

$\square$ Concentration
$\square$ Catalyst
$\square$ Pressure
T Temperature

## For the reaction below, deduce an expression for $\mathrm{K}_{\mathrm{c}}$.

$$
2[\mathrm{~A}]+3[\mathrm{~B}]+[\mathrm{C}] \rightleftharpoons[\mathrm{D}]+4[\mathrm{E}]
$$

For the reaction below, deduce an expression for $K_{c}$.

$$
2[\mathrm{~A}]+3[\mathrm{~B}]+[\mathrm{C}] \rightleftharpoons[\mathrm{D}]+4[\mathrm{E}]
$$

## $K_{c}=$

## Deduce units for the value of $\mathrm{K}_{\mathrm{c}}$ when:

## $\mathrm{K}_{\mathrm{c}}=$ [D][E] ${ }^{4}$ <br> $[A]^{2}[B]^{3}[C]$

## Deduce units for the value of $\mathrm{K}_{\mathrm{c}}$

## $\mathrm{mol}^{-1} \mathrm{dm}^{3}$

## What type of system is $\mathrm{K}_{\mathrm{c}}$ relevant for?

## What type of system is $\mathrm{K}_{\mathrm{c}}$ relevant for?

## Homogeneous systems in equilibrium.

# What does $\mathrm{K}_{\mathrm{c}}$ being greater or less than 1 suggest for the position of equilibrium? 

What does $\mathrm{K}_{\mathrm{c}}$ being greater of lesser than 1 suggest for the position of equilibrium?

## Greater than 1 = shifted to the right Lesser than 1 = shifted to the left

What effect does decreasing the temperature in an endothermic reaction have on $\mathrm{K}_{\mathrm{c}}$ ?

What effect does decreasing the temperature in an endothermic reaction have on $\mathrm{K}_{\mathrm{c}}$ ?

## $\mathrm{K}_{\mathrm{c}}$ decreases

(The endothermic reaction isn't favoured so equilibrium shifts to the left.)

## What effect does increasing the temperature in an endothermic reaction have on $\mathbf{K}_{\mathrm{c}}$ ?

What effect does increasing the temperature in an endothermic reaction have on $\mathrm{K}_{\mathrm{c}}$ ?

## $\mathrm{K}_{\mathrm{c}}$ increases

(The endothermic reaction is favoured so equilibrium shifts to the right.)

What effect does decreasing the temperature in an exothermic reaction have on $\mathbf{K}_{\mathbf{c}}$ ?

What effect does decreasing the temperature in an exothermic reaction have on $\mathrm{K}_{\mathrm{c}}$ ?

## $\mathrm{K}_{\mathrm{c}}$ increases

(The exothermic reaction is favoured so equilibrium shifts to the right.)

## What effect does increasing the temperature in an exothermic reaction have on $\mathrm{K}_{\mathrm{c}}$ ?

What effect does increasing the temperature in an exothermic reaction have on $\mathrm{K}_{\mathrm{c}}$ ?

## $\mathrm{K}_{\mathrm{c}}$ decreases

(The exothermic reaction isn't favoured so equilibrium shifts to the left.)
