## OCR (A) Chemistry A-level

## Practicals: Mathematical Skills

Arithmetics

## Unit prefixes

Most commonly used prefixes in the exam.

| Factor | Name | Symbol |
| :--- | :--- | :--- |
| $10^{6}$ | Mega | M |
| $10^{3}$ | kilo | k |
| $10^{-1}$ | deci | d |
| $10^{-2}$ | centi | c |
| $10^{-3}$ | milli | m |
| $10^{-6}$ | micro | $\mu$ |

- $1 \mathrm{~kg}=1000 \mathrm{~g}=10^{3} \mathrm{~g}$

## Power Laws

$X^{m} \times X^{n}=X^{m+n} \quad$ multiplicative rule
$\frac{x^{m}}{X^{n}}=X^{m-n} \quad$ division rule
$\left(X^{m}\right)^{n}=X^{m n} \quad$ power rule
$X^{-m}=\frac{1}{X^{m}} \quad$ reciprocal rule
$X^{m / n}=\sqrt[n]{X^{m}} \quad$ root rule

- $\mathrm{mol} \mathrm{x}_{1 / \mathrm{dm}^{3}=\mathrm{mol} \mathrm{dm}^{-3}}$

## Key unit conversions

- $1 \mathrm{dm}^{3}=1 \mathrm{~L}$
- $1 \mathrm{~cm}^{3}=1 \mathrm{ml}$
- $1 \mathrm{dm}^{3}=10^{3} \mathrm{~cm}^{3}$
- Kelvin $(\mathrm{K})=273+$ degree celcius $\left({ }^{\circ} \mathrm{C}\right)$

## Amount of substance

- Relative masses (isotopic, atomic, formula, molecular, etc) don't have units. - E.g relative atomic mass of magnesium is 24.3

## Energetics

- Unit of entropy values $=\mathrm{J} \mathrm{K}^{-1} \mathrm{~mol}^{-1}$
- Unit of enthalpy values $=\mathrm{kJ} \mathrm{mol}^{-1}$

Kinetics and equilibria For example, for the equation

$$
\begin{gathered}
\text { rate }=k[A]^{2}[B] \\
k=\frac{\text { rate }}{[A]^{2}[B]}=\frac{\mathrm{mol} \mathrm{dm}^{-3} \mathrm{~s}^{-1}}{\left(\mathrm{~mol} \mathrm{dm}^{-3}\right)^{2}\left(\mathrm{~mol} \mathrm{dm}^{-3}\right)}
\end{gathered}
$$

When simplified, mol dm ${ }^{-3}$ can often be cancelled. E.g.

$$
\frac{\mathrm{moldm}^{-3} s^{-1}}{\mathrm{~mol}^{2} d m^{-6} \times \mathrm{moldm}^{-3}}=\frac{s^{-1}}{\mathrm{~mol}^{2} \mathrm{dm}^{-6}}=\mathrm{dm}^{6} \mathrm{~mol}^{-2} \mathrm{~s}^{-1}
$$

Remember: $\frac{X^{m}}{X^{n}}=X^{m-n}$

Note - Put positive indices first when writing compound units

## Decimal places

When adding or subtracting the same type of measurements, the answer must also be to the same number of decimal places

## Example

- $5.998 \mathrm{~g}+6.789 \mathrm{~g}=12.787 \mathrm{~g}$; answer is written to the same number of decimal places and not to the lowest number of significant figures
- Note - when a calculation involves raw data with varying numbers of significant figures, you must give your answer to the lowest number of significant figures in the raw data used.

## Standard forms

When converting between standard form and decimal, significant figures must be retained.

Example - $0.0080 \mathrm{~mol} \mathrm{dm}^{-3}=8.0 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$
When using standard form and a calculator:

| Calculator make | Convert decimal to standard | Enter numbers in standard form |
| :--- | :--- | :--- |
| Sharp | Change | EXP |
| Casio | S $\rightarrow \mathrm{D}$ | x 10 x |

## Measuring quantities by difference

## Example

Initial mass $\quad 30.5 \mathrm{~g}$
After effervescence 21.59
Change in mass
9.0 g

The ' 0 ' in change in mass is significant in order to have the result to 1 decimal place, so must be included.

## The Avogadro constant

Note - The data sheet value of the constant is $6.02 \times 10^{23}$, which is to 3 significant figures

## Effect of changing parameters

Example

$$
A=\frac{X Y}{Z \times T^{3}}
$$

In this formula,

- Larger the numerator (increase in X or Y), larger the output (increases A)
- Larger the denominator (increase in Z or T), smaller the output (decreases A)
- The reverse is true in each case

## Equilibrium constants

$\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightleftharpoons 2 \mathrm{NH}_{3}$

$$
K c=\frac{\left[N H_{3}\right]^{2}}{\left[N_{2}\right]\left[H_{2}\right]^{3}}
$$

- Using this equation, if ammonia is removed from the reaction vessel, the concentration of ammonia will decrease so the numerator will also decrease.
- If the denominator remained the same, removing ammonia would cause $\mathrm{K}_{\mathrm{c}}$ to decrease. However, as temperature is constant, $\mathrm{K}_{\mathrm{c}}$ must stay the same.
- In order to keep $\mathrm{K}_{\mathrm{c}}$ the same, if the numerator decreases, the denominator must decrease.
- Hence, the position of equilibrium shifts to the right.

## Logarithms

Use 'log' for base 10 logarithms and use 'In' for base e logarithms

## Data Handling

## Outliers

Outliers should be omitted from the data set when doing calculations.

## Calculating mean titre

|  | Trial | 1st run | 2nd run | 3rd run |
| :--- | :--- | :--- | :--- | :--- |
| Final reading $/ \mathrm{cm}^{3}$ | 22.90 | 45.40 | 43.05 | 22.55 |
| Initial reading $/ \mathrm{cm}^{3}$ | 0.00 | 22.90 | 20.95 | 0.00 |
| Titre Titre $/ \mathrm{cm} 3$ | 22.90 | 22.50 | 22.10 | 22.55 |

From the table, the 1st and 3rd runs are concordant. The mean titre can be calculated using these values:

$$
\frac{22.50+22.55}{2}=22.525 \mathrm{~cm}^{3}
$$

Note - the unrounded value of the mean should be used in the further calculations.

## Uncertainty

If a $250 \mathrm{~cm}^{3}$ volumetric flask has an absolute uncertainty of $0.2 \mathrm{~cm}^{3}$, the volume measured with that flask can be between $249.8 \mathrm{~cm}^{3}$ and $250.2 \mathrm{~cm}^{3}$.

$$
\% \text { uncertanity }=\frac{\text { absolute uncertanity }}{\text { quantity measured }} \times 100 \%
$$

Note - if you are measuring a difference, multiply the numerator by a factor of 2 because there will be an uncertainty associated with both readings.

## Algebra

## Symbol

< means 'less than'
<< means 'much less than'
$>$ means 'more than'
>> means 'much more than'
$\propto$ means 'is proportional to'
$\rightleftharpoons$ means 'both forward and backward reactions are happening in the system'
$\sim$ means 'roughly equal to'

## Rates

Rate $\propto[A]^{2}$ means the rate of reaction is proportional to the square of the concentration of $A$.

## Rearranging Arrhenius equation

Given the exponential equation

$$
k=A e^{-E a / R T}
$$

Before getting rid of the exponential, put the coefficient (A) on the other side

$$
\frac{k}{A}=e^{-E_{a} / R T}
$$

Take natural logs on both side

$$
\ln \left(\frac{k}{A}\right)=-\frac{E_{a}}{R T}
$$

According to the log law

$$
\begin{gathered}
\log \left(\frac{A}{B}\right)=\log A-\log B \\
\ln k-\ln A=-\frac{E_{a}}{R T}
\end{gathered}
$$

Finally,

$$
\ln k=-\frac{E_{a}}{R T}+\ln A
$$

To calculate the activation energy or the pre-exponential factor from data, use the logarithmic form of the Arrhenius Equation with In $k$ on the $y$ axis, and 1 the $x$ axis.

Then: gradient $=\frac{-E_{a}}{R}, y$ intercept $=\ln A$

## Graphs

## Plotting graph

Key points to remember

- Use appropriate linear scale
- Label the axes including the units
- All the points must be plotted within the graph area
- Graph should make good use of space available
- Plotted points must be within 1 square of the correct value
- When drawing a line of best fit, a ruler must be used to draw a line which goes through most of the points.
Note - for rate vs concentration graphs, the line of best fit must go through the origin.
Interpolation - the line of best fit can be used to read a value within the experimental range.
Extrapolation - the line of best fit needs to be extended to the appropriate point

Rate experiment

| Time $/ \mathrm{s}$ | 30 | 50 | 80 | 120 | 180 | 240 | 350 | 470 | 600 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\left[\mathrm{Br}_{2}\right] / \mathrm{mol}$ <br> $\mathrm{dm}^{-3}$ | 0.0090 | 0.0080 | 0.0073 | 0.0067 | 0.0052 | 0.0044 | 0.0029 | 0.0020 | 0.0012 |

Suitable axis will depend on the size of the graph paper, but sensible axis would be

- $0-700 \mathrm{~s}$, with 10 s per square for the x axis
- $0-0.0100 \mathrm{~mol} \mathrm{dm}^{-3}$, with $0.0001 \mathrm{~mol} \mathrm{dm}^{-3}$ per square for the $y$ axis

## Gradient

$$
\text { gradient }=\frac{\text { change in } y}{\text { change in } x}
$$

Note - to calculate the gradient, the two points selected must be on the line of best fit. You should not use two of the plotted points. You should aim to maximise the values of 'change in $y$ ' and 'change in x' when choosing your points.

## Tangent

To draw a tangent

- Use a pencil and ruler
- Line the ruler up with the point where the tangent being drawn
- When aligning the ruler, avoid covering the curve with the ruler to ensure that all of the curve is visible.
