Show your working and appropriate significant figures in the final answer to each step of your calculations.

1 Limewater is a saturated solution of calcium hydroxide, $\mathrm{Ca}(\mathrm{OH})_{2}$, in water. In this experiment you will determine the concentration of limewater by titration with hydrochloric acid.

FB 1 is limewater.
FB 2 is $0.500 \mathrm{moldm}^{-3}$ hydrochloric acid, HCl .
bromophenol blue indicator
(a) Method

## Dilution of FB 2

- Pipette $25.0 \mathrm{~cm}^{3}$ of FB 2 into the $250 \mathrm{~cm}^{3}$ volumetric flask.
- Make the solution up to the mark using distilled water.
- Shake the solution in the volumetric flask thoroughly.
- This solution of hydrochloric acid is FB 3. Label the volumetric flask FB 3.
- Rinse the pipette thoroughly.

## Titration

- Fill the burette with FB 3.
- Pipette $25.0 \mathrm{~cm}^{3}$ of FB 1 into a conical flask.
- Add a few drops of bromophenol blue.
- Perform a rough titration and record your burette readings in the space below.
$\qquad$ $\mathrm{cm}^{3}$.
- Carry out as many accurate titrations as you think necessary to obtain consistent results.

| I |  |

| II |  |
| III |  |
| IV |  |
| V |  |
| VI |  |
| VII |  |

- Make sure any recorded results show the precision of your practical work.
- Record in a suitable form below all of your burette readings and the volume of FB 3 added in each accurate titration.
(b) From your accurate titration results, obtain a suitable value for the volume of FB 3 to be used in your calculations.
Show clearly how you obtained this value.

(v) Calculate the mass of calcium hydroxide dissolved in $1.00 \mathrm{dm}^{3}$ of limewater, FB 1.

2 In this experiment you will determine the enthalpy change, $\Delta H$, for the decomposition of calcium hydroxide.

$$
\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s}) \rightarrow \mathrm{CaO}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

To do this, you will determine the enthalpy changes for the reactions of calcium hydroxide and calcium oxide with hydrochloric acid. Excess acid will be used for both experiments.

Then you will use Hess' Law to calculate the enthalpy change for the reaction.
FB 4 is calcium hydroxide, $\mathrm{Ca}(\mathrm{OH})_{2}$.
FB 5 is calcium oxide, CaO .
FB 6 is $2.50 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid, HCl .

- Use the measuring cylinder to transfer $40 \mathrm{~cm}^{3}$ of FB 6 into the plastic cup.
- Measure and record the temperature of FB 6.

(ii) Calculation

Calculate the enthalpy change, in $\mathrm{kJ} \mathrm{mol}^{-1}$, for the reaction below.

$$
\mathrm{CaO}(\mathrm{~s})+2 \mathrm{HCl}(\mathrm{aq}) \rightarrow \mathrm{CaCl}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l})

(c) Use your values for the enthalpy changes calculated in (a)(iv) and (b)(ii) to calculate the enthalpy change for the decomposition of calcium hydroxide.

Show clearly how you obtained your answer.
(If you were unable to calculate the enthalpy changes, assume that the magnitude of the enthalpy change in (a)(iv) is $164 \mathrm{~kJ} \mathrm{~mol}^{-1}$ and the magnitude in (b)(ii) is $191 \mathrm{~kJ} \mathrm{~mol}^{-1}$.
Note: these may not be the correct magnitudes and the signs have been deliberately omitted.)

$$
\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s}) \rightarrow \mathrm{CaO}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})

$$

(d) (i) The experiment in (b) was repeated, using the same mass of calcium oxide, FB 5. However, $40 \mathrm{~cm}^{3}$ of $3.0 \mathrm{moldm}^{-3} \mathrm{HCl}$ was used instead of $40 \mathrm{~cm}^{3}$ of $2.5 \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{HCl}$.

How would the temperature rise compare with the one you obtained in (b)(i)? Explain your answer.

(ii) A student suggested that the experiment in (a) would be more accurate if a taller plastic cup of the same diameter was used.

Do you agree with the student? Explain your answer.

## Qualitative Analysis

Where reagents are selected for use in a test, the name or correct formula of the element or compound must be given.

At each stage of any test you are to record details of the following:

- colour changes seen;
- the formation of any precipitate and its solubility in an excess of the reagent added;
- the formation of any gas and its identification by a suitable test.

You should indicate clearly at what stage in a test a change occurs.
If any solution is warmed, a boiling tube must be used.
Rinse and reuse test-tubes and boiling tubes where possible.

## No additional tests for ions present should be attempted.
