UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS GCE Advanced Subsidiary Level and GCE Advanced Level

MARK SCHEME for the May/June 2008 question paper

9701 CHEMISTRY

9701/04

Paper 4 (A2 Structured Questions), maximum raw mark 100

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began.

All Examiners are instructed that alternative correct answers and unexpected approaches in candidates' scripts must be given marks that fairly reflect the relevant knowledge and skills demonstrated.

Mark schemes must be read in conjunction with the question papers and the report on the examination.

• CIE will not enter into discussions or correspondence in connection with these mark schemes.

CIE is publishing the mark schemes for the May/June 2008 question papers for most IGCSE, GCE Advanced Level and Advanced Subsidiary Level syllabuses and some Ordinary Level syllabuses.

Pa	ge 2	2	Mark Scheme GCE A/AS LEVEL – May/June 2008	Syllabus 9701	Paper 04
(a)	(i)	A is	Cl ₂ /chlorine	0701	[1]
()	(-)				
		BIS	NaC <i>l or</i> HC <i>l or</i> C <i>l</i> ⁻ [or words], etc.		[1]
		C is	salt bridge or KC//KNO ₃ , etc.		[1]
		D is	platinum/Pt		[1]
		E is	Fe ²⁺ + Fe ³⁺ or mixture of Fe(II) + Fe(III) salts		[1]
			tion of standard conditions ([Cl^{-}] of 1 mol dm ⁻³ or Cl_2 a = 25°C/298 K)	at 1 atmos	[1]
	(ii)		$E_{R}^{\circ} - E_{I}^{\circ} = 0.77 - 1.36 = (-)0.59$ (V) (ignore sign)		[1] [1]
	(11)				
			e R.H. electrode is negative) electrons flow (from ri trode <i>or</i> anticlockwise <i>or</i> from (beaker) E to (beaker) B		o the chlorine [1]
(b)	(i)		= 3 ×(−167.2) + (−48.5) − (−399.5) = −150.6 or 151 (kJ mol ^{−1})		[1] [1]
			rect ans [2])		[.]
	(ii)		$^{+}$ + Cu \longrightarrow 2Fe ²⁺ + Cu ²⁺		[1]
		(<i>or</i> n	nolecular: $2FeCl_3 + Cu \longrightarrow 2FeCl_2 + CuCl_2$)		
			0.77 − 0.34 = (+) 0.43 (V) mark for −0.43V)		[1]
				l	[Total: 12 max 1
(a)	(i)	ΔH	= 4 × 278 – 244 – 2 × 496		[1]
			= –124 (kJ mol ^{–1}) rect ans [2])		[1]
	(ii)	•	be is bent/V-shaped/non-linear (<i>or</i> diagram)	- h	[1]
		(ass	to (one) lone pair <i>and/or</i> (1) odd/unpaired electron (<i>or</i> ume electrons are on chlorine unless explicitly stat rd no mark)		[1] n which case

(iii)
$$3KClO_3 + H_2SO_4 \longrightarrow K_2SO_4 + KClO_4 + H_2O + 2ClO_2$$
 [1] [5]

- - (ii) causes acid rain [1] which lower pH of lakes; leaches aluminium from soils; kills fish/plants/rainforests; dissolves/corrodes/damages buildings (any 1) [1] (NOT asthma etc – since this is not environmental) [3]

10 (a) any two of the following:

- to speed delivery (of drug to target organ), i.e. faster response
- to avoid the drug being hydrolysed/reacted/decomposed (NOT digested) in the stomach
- to allow a smaller dose to be used or greater accuracy of dosage
- patient does not have to be conscious
- (b) (i) spheres with a diameter of the order of nanometres/in the nanometre range/between 10 & 500 nm [1]
 - (ii) it is (highly) acidic *or* low pH *or* contains HC*l* (NOT contains enzymes) [1]
 - (iii) use hydrogels: of different (wall) thickness/strength (to release drug over time) of different chemical composition (for different breakdown times) incorporating pores/holes (in their walls)
 (any two) [1] + [1]

[4]

2 × [1] [2]

(c) for the homopolymer, either using the amino acid the minimum is:

-CO-CHR-NH-CO-CHR-NH-

or using the hydroxyacid the minimum is:

(-[1] for each error) [2]

for the **heteropolymer**, *either* using the glycol compound and the di-acid the minimum is:

or using the amino acid and the di-acid, the minimum is:

(A heteropolymer incorporating all three monomers can also be drawn. This should include an ester linkage between the glycol and one of the CO_2H groups, and an amide linkage between the aminoacid and another CO_2H group. Deduct [1] mark from the whole of section (c) if complete compounds are shown rather than sections of chains. Allow 4-monomer sections instead of 3. Allow [2] marks for a polymer section even if **one** end is incomplete (e.g. is lacking an oxygen atom), but if **both** ends are incomplete deduct [1]) (-[1] for each error) [2] [4]
