CHEMISTRY 9701/52

Paper 5 Planning, Analysis and Evaluation

February/March 2017 1 hour 15 minutes

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer all questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

Use of a Data Booklet is unnecessary.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

1 The enthalpy change of reaction, ΔH_r , for the decomposition of sodium hydrogenearbonate, NaHCO₃(s), cannot be measured directly.

$$2NaHCO_3(s) \rightarrow Na_2CO_3(s) + H_2O(l) + CO_2(g)$$

A student must carry out **two** separate experiments and use the results of these experiments to determine the enthalpy change of reaction for the decomposition of sodium hydrogencarbonate.

(a) Suggest why the enthalpy change of reaction, ΔH_r, for the decomposition of sodium hydrogencarbonate cannot be measured directly.
[11]

In both experiments the student used a weighing boat. A weighing boat is a small vessel used to contain solid samples when they are weighed.

Experiment 1 Reaction between sodium carbonate, $Na_2CO_3(s)$, and dilute hydrochloric acid, HCl(aq)

- **step 1** The student added approximately 3 g of Na₂CO₃(s) to a weighing boat and accurately measured the combined mass of the weighing boat and Na₂CO₃(s). This mass was recorded in Table 1.1.
- **step 2** The student used a measuring cylinder to measure $50 \, \text{cm}^3$ of $2 \, \text{mol dm}^{-3} \, \text{HC} \, l(\text{aq})$.
- **step 3** The experiment was carried out and the results were recorded in Table 1.2.
- **step 4** The student reweighed the empty weighing boat and recorded the mass in Table 1.1.

Table 1.1 mass results from Experiment 1

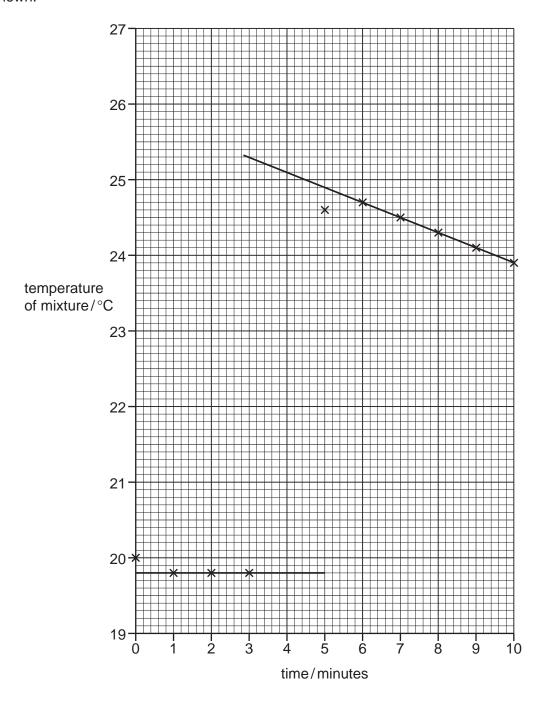

mass of weighing boat and Na ₂ CO ₃ (s)/g	4.15
mass of empty weighing boat after addition of Na ₂ CO ₃ (s) to HCl(aq)/g	0.97
mass of Na ₂ CO ₃ (s) added/g	

Table 1.2 temperature results from Experiment 1

time/minutes	0	1	2	3	5	6	7	8	9	10
temperature of mixture/°C	20.0	19.8	19.8	19.8	24.6	24.7	24.5	24.3	24.1	23.9

(b)	Outline how the student carried out step 3 of the experiment. You may find it helpful to write your answer as a series of smaller steps.
	Draw a labelled diagram of the apparatus.

The student plotted a graph of the results and drew **two** lines of best fit which were both extrapolated as shown.

(c) Use the graph to determine the theoretical temperature increase at 4 minutes.

theoretical temperature increase =°C [1]

(d)	Use Table 1.1 on page 2 to determine the mass of Na ₂ CO ₃ (s) which was added to the HCl(aq).
	Use this value and your answer to (c) to determine the enthalpy change, ΔH_1 , for the reaction
	shown.

$$Na_2CO_3(s) + 2HCl(aq) \rightarrow 2NaCl(aq) + H_2O(l) + CO_2(g)$$

Give your answer to **three** significant figures. [Assume that the specific heat capacity of the solution is $4.18 \, \mathrm{Jg^{-1}\,K^{-1}}$.] [A_r : Na, 23.0; C, 12.0; O, 16.0]

$\Delta H_1 =$	k	κJ mol⁻¹	[3]
----------------	---	----------	-----

- (e) (i) Explain why the student did **not** add the Na₂CO₃(s) to the HC*l*(aq) at 0 minutes.
 - (ii) Suggest why the temperature measured at 5 minutes was lower than the temperature measured at 6 minutes.

......[1]

- **Experiment 2** Reaction between sodium hydrogencarbonate, NaHCO₃(s), and dilute hydrochloric acid, HC*l*(aq)
- **step 1** The student weighed an empty weighing boat and recorded the mass in Table 1.3.
- **step 2** The student added exactly 4.20 g of NaHCO₃(s) to the weighing boat and recorded the mass in Table 1.3.
- **step 3** The student carried out the same experimental procedure as in **steps 2** and **3** of Experiment 1.

Table 1.3 mass results from Experiment 2

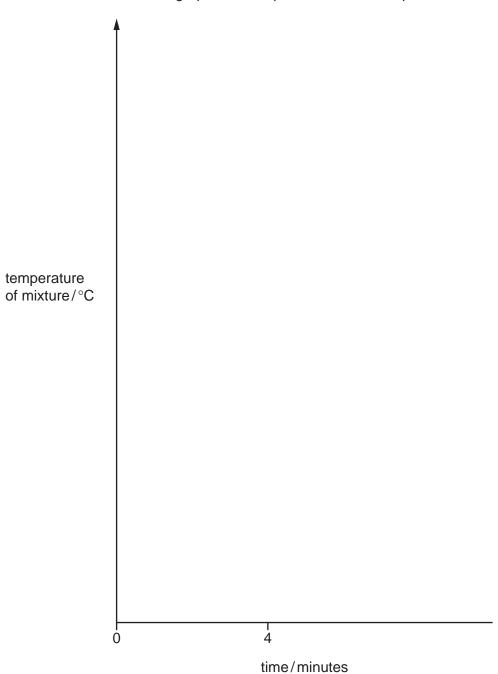

mass of empty weighing boat/g	0.95
mass of weighing boat and NaHCO ₃ (s)/g	5.15
mass of NaHCO ₃ (s) added/g	

(f)		plain why the method of determining the mass of solid added in Experiment 2 is less accurate in the method of determining the mass of solid added in Experiment 1.
		[1]
(g)	(i)	In Experiment 2 a $50\mathrm{cm^3}$ measuring cylinder was used to measure the $50\mathrm{cm^3}$ of HC $l(aq)$. The $50\mathrm{cm^3}$ measuring cylinder had $1\mathrm{cm^3}$ graduations.
		Calculate the maximum percentage error in measuring $50\mathrm{cm^3}$ of $HC\mathit{l}(aq)$ with this $50\mathrm{cm^3}$ measuring cylinder.
		maximum percentage error = % [1]
	(ii)	Explain why measuring the concentration of the $2 \text{mol dm}^{-3} \text{HC} l$ more precisely would not affect the result of the experiment.
		[1]
((iii)	Suggest what the student should change to reduce the percentage error associated with the temperature readings without changing the apparatus.
		[1]

(h) The student used the results from Experiment 2 and correctly determined the enthalpy change for the reaction between NaHCO₃(s) and HCl(aq), ΔH_2 , to be +24.2 kJ mol⁻¹.

$$\mathsf{NaHCO_3(s)} \ + \ \mathsf{HC}\mathit{l}(\mathsf{aq}) \ \to \ \mathsf{NaC}\mathit{l}(\mathsf{aq}) \ + \ \mathsf{H_2O(I)} \ + \ \mathsf{CO_2(g)} \qquad \Delta H_2 = +24.2 \, \mathsf{kJ} \, \mathsf{mol^{-1}}$$

Use the axes to draw a sketch graph of the expected results of Experiment 2.

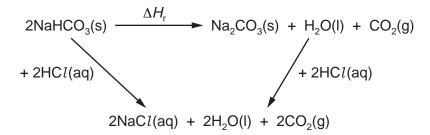

[2]

(i) Use ΔH_1 from (d) and ΔH_2 from (h) to determine the enthalpy change of reaction, ΔH_r , for the decomposition of NaHCO₃(s).

$$2NaHCO_3(s) \rightarrow Na_2CO_3(s) + H_2O(l) + CO_2(g)$$

An energy cycle has been drawn for you.

If you were unable to calculate ΔH_1 in **(d)**, assume $\Delta H_1 = -26.7 \,\text{kJ}\,\text{mol}^{-1}$. This is **not** the correct value of ΔH_1 .

$$\Delta H_{\rm r} = \text{kJ mol}^{-1} [2]$$

[Total: 18]

2 Transition metal complex ions are coloured. The formula of a complex ion can be determined using colorimetry.

In colorimetry, light of a certain wavelength is passed through a complex ion solution. The absorbance of the light is proportional to the intensity of the colour of the solution. The more concentrated the complex ion solution, the more intense its colour and so the higher the absorbance.

A student carried out an experiment to determine the formula of the complex ion formed between aqueous iron(III) ions, $Fe^{3+}(aq)$, and aqueous 2-hydroxybenzoate ions, $C_6H_4(OH)CO_2^-$, which have the structure shown.

- (a) In the first step of the experiment the student prepared 100.0 cm³ of 0.0500 mol dm⁻³ aqueous iron(III) nitrate.
 - (i) Determine the mass, in g, of solid hydrated iron(III) nitrate, $Fe(NO_3)_3.9H_2O$, needed to prepare $100.0 \, \text{cm}^3$ of a $0.0500 \, \text{mol dm}^{-3}$ solution. [A_r : Fe, 55.8; N, 14.0; O, 16.0; H, 1.0]

mass of
$$Fe(NO_3)_3.9H_2O =g$$
 [2]

(ii) Describe how, after weighing the mass determined in (i), the student should prepare 100.0 cm³ of 0.0500 mol dm⁻³ aqueous iron(III) nitrate.

In your answer you must give the name and capacity, in cm³, of any apparatus used.

[2]

[2]

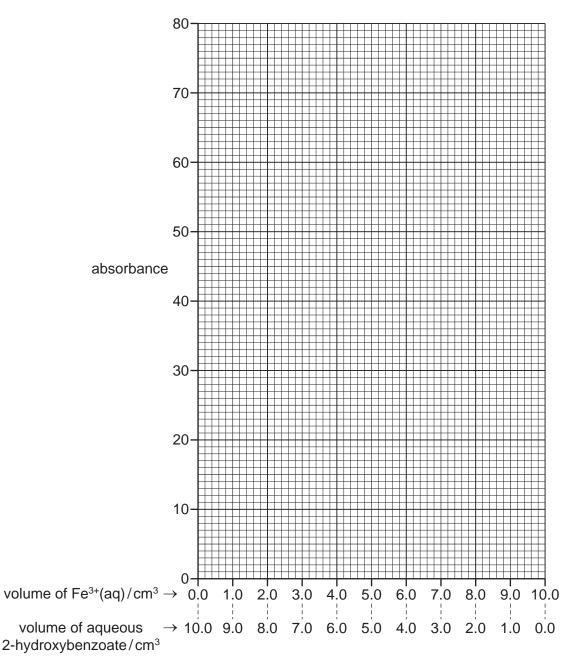

(b) The student prepared solutions containing various combinations of 0.0500 mol dm⁻³ Fe³⁺(aq) and 0.0500 mol dm⁻³ aqueous 2-hydroxybenzoate, as shown in the table.

The student placed a small sample of each solution into a colorimeter and measured the absorbance. The student made a mistake in test number 9 and did **not** measure the result.

test number	1	2	3	4	5	6	7	8	9	10	11
volume of Fe ³⁺ (aq)/cm ³	0.0	1.0	2.0	3.0	4.0	5.0	6.0	7.0		9.0	10.0
volume of aqueous 2-hydroxybenzoate/cm³	10.0	9.0	8.0	7.0	6.0	5.0	4.0	3.0		1.0	0.0
absorbance	0	23	46	69	70	58	47	35		13	0

(i) Plot a graph on the grid to show the relationship between absorbance and the volumes of Fe³⁺(aq) and aqueous 2-hydroxybenzoate used.

Use a cross (x) to represent each data point. Draw two lines of best fit.

(11)	which would give the maximum absorbance.
	volume of Fe ³⁺ (aq) =
	volume of aqueous 2-hydroxybenzoate =cm
(iii)	The point of maximum absorbance shows where all of the ions are combined in the complex.
	Use the volumes in (ii) to determine the number of moles of 2-hydroxybenzoate ions that form a complex with 1 mole of Fe ³⁺ ions.
	moles of 2-hydroxybenzoate ions = [1
(iv)	Fe ³⁺ (aq) ions exist in aqueous solution as complex ions with the formula $[Fe(H_2O)_6]^{3+}(aq)$ 2-hydroxybenzoate ions, $C_6H_4(OH)CO_2^-$, are bidentate ligands.
	Use this information and your answer to (iii) to suggest the formula of the complex ior formed between Fe³+(aq) ions and 2-hydroxybenzoate ions.
	[1
(v)	Name the apparatus that should be used to measure the volumes of the solutions given in the table accurately.
	[1]

12

(c)	In test 9, instead of mixing 8.0 cm ³ of Fe ³⁺ (aq) and 2.0 cm ³ of aqueous 2-hydroxybenzoate, the
	student mixed 16.0 cm ³ of Fe ³⁺ (aq) and 4.0 cm ³ of aqueous 2-hydroxybenzoate.

Use your graph in **(b)(i)** to suggest the absorbance that would have been measured if a sample of this solution had been analysed in the colorimeter.

(d) In a colorimetry experiment, the absorbance of the solution follows the relationship shown.

$$A = \varepsilon c l$$

A is the absorbance (no units).

c is the concentration in mol dm^{-3} .

l is the path length of the light travelling through the solution in cm.

 ε is the molar absorption coefficient (a constant).

Determine the unit of ε .

unit =[1]
