## $\frac{\text { WJEC }}{\text { CBAC }}$

## GCE MARKING SCHEME

## CHEMISTRY (NEW) ASIAdvanced

## CH2

## Section A

1. 

| Conducts electricity |  | Melting temperature |  | Bonding |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Yes | No | High | Low | Covalent | Ionic |
| $\checkmark$ |  | $\checkmark$ |  | $\checkmark$ |  |

2. (i) $\mathrm{Ba}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Ba}(\mathrm{OH})_{2}+\mathrm{H}_{2}$
(ii) Reagent: e.g. sulfuric acid

Observation: white precipitate
3. (i) There is no free rotation about a double bond / the compound has two different groups either side of the double bond
(ii) potassium dichromate(VI) / $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7} /$ dichromate $/ \mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$
(iii) oxidation / redox
(iv) (relative) molecular mass / molar mass
4. (i) $\mathrm{F}_{2}+2 \mathrm{e}^{-} \rightarrow 2 \mathrm{~F}^{-}$
(ii) (A) fluorine (atom) needs to gain an electron to have a full (outer) shell / fluorine has a high electronegativity

## Section B

5. 

(a)
(i) atom economy =

$$
\underline{34 \times 100}
$$

$$
(1)=19 \text { (1) }
$$

$$
(2 \times 53.5)+74
$$

(ii) $45 \mathrm{~g} / 100 \mathrm{~cm}^{3} \equiv 450 \mathrm{~g} \mathrm{dm}^{-3}$

$$
\begin{equation*}
\text { concentration }=\frac{450}{111}=4.05(\text { accept } 4.1) \mathrm{mol} \mathrm{dm}^{-3} \text { (1) } \tag{1}
\end{equation*}
$$

(iii) $\mathrm{Ca}+2 \mathrm{HCl} \rightarrow \mathrm{CaCl}_{2}+\mathrm{H}_{2}$
(iv) orange-red / brick red
(v) Reagent: silver nitrate / $\mathrm{AgNO}_{3} / \mathrm{Ag}^{+} /$silver ions
Observation: white precipitate
[2]
(vi)

left hand side correct (1)
right hand side correct (1)
(vii) 111 g of calcium chloride removes $/$ react with $2 \times 18.0 \mathrm{~g}$ water (1)

$$
\begin{align*}
\therefore 5.55 \mathrm{~g} \text { of calcium chloride mass removes } / \text { reacts with } & =\frac{5.55 \times 2 \times 18.0}{111} \\
& =1.80(\mathrm{~g}) \tag{1}
\end{align*}
$$

or in moles:
moles of calcium chloride 0.05 (1) moles of water 0.10 (1)
(viii) a covalent bond where one of the atoms (of the bond) provides both electrons
6.
(a)
(i)
○ $\mathrm{Na}^{+}$
$\bigcirc \mathrm{Cl}^{-}$
(ii) $6: 6$
(iii) $8: 8$
(1)
$\mathrm{Cs}^{+}$ion / cation is much larger than the $\mathrm{Cl}^{-}$ion / anion (1)
(b) (i) $\mathrm{Na}^{+}$ions are attracted to ( $\delta-$ ) oxygen of water molecules (1)
$\mathrm{Cl}^{-}$ions are attracted to ( $\delta+$ ) hydrogen of water molecules (1)
(ii) I Mass of evaporating basin + sodium chloride solution $=140.57 \mathrm{~g}$ Mass of evaporating basin $\quad=72.00 \mathrm{~g}$
$\therefore \quad$ Mass of sodium chloride solution $\quad=68.57 \mathrm{~g}$
Mass of evaporating basin + dry sodium chloride $\quad=90.57 \mathrm{~g}$
Mass of evaporating basin $\quad=72.00 \mathrm{~g}$
$\therefore \quad$ Mass of dry sodium chloride $\quad=18.57 \mathrm{~g}$

II $\quad 50.00 \mathrm{~g}$
III $2 \times 18.57=37.14 \mathrm{~g} / 100 \mathrm{~g}$ water
IV temperature
(c) the outer electron of an atom is an selectron
(d)

$$
\begin{array}{cccc}
4 \mathrm{Na} & +\mathrm{TiCl}_{4} & \rightarrow \mathrm{Ti}+4 \mathrm{NaCl} \\
0 & +4(-1 \times 4) & 0 & 4(+1) 4(-1) \tag{1}
\end{array}
$$

sodium has increased its oxidation number i.e. oxidation
7. (a) (i) Separation of the alkanes by differences in their boiling temperatures
(ii) $\mathrm{C}_{9} \mathrm{H}_{20}$
(iii) Breaking of larger (alkane) molecules into smaller molecules (1) which are more useful / in relative short supply (1)
(iv)

(b) (i) The chlorine molecule is split by UV light (1) by homolytic fission (1) giving two chlorine free radicals

$$
\mathrm{Cl}_{2} \rightarrow 2 \mathrm{Cl} \bullet \text { (1) }
$$

In the propagation stage radicals react to produce new radicals

$$
\begin{align*}
& \mathrm{CH}_{3} \mathrm{Cl}+\mathrm{Cl} \bullet \rightarrow \bullet \mathrm{CH}_{2} \mathrm{Cl}+\mathrm{HCl}  \tag{1}\\
& \bullet \mathrm{CH}_{2} \mathrm{Cl}+\mathrm{Cl}_{2} \rightarrow \mathrm{CH}_{2} \mathrm{Cl}_{2}+\mathrm{Cl} \bullet \tag{1}
\end{align*}
$$

In the termination stage two radicals combine giving dichloromethane

$$
\bullet \mathrm{CH}_{2} \mathrm{Cl}+\mathrm{Cl} \bullet \quad \rightarrow \quad \mathrm{CH}_{2} \mathrm{Cl}_{2}
$$

(QWC) organise information clearly and coherently, using specialist vocabulary when appropriate
(ii) $\mathrm{C}_{2} \mathrm{H}_{4} \mathrm{Cl}_{2}$ (1) displayed formula is

(accept the displayed formula of 1,1-dichloroethane)
formed by the reaction together of two $\bullet \mathrm{CH}_{2} \mathrm{Cl}$ radicals
8. (a) (i) I the colour changes from red/brown/orange to colourless

II the name of the compound is 1,2,3-tribromobutane /
1,3-dibromobutan-2-ol / 1,2-dibromobutan-3-ol
(ii) I (warm) with (aqueous) sodium hydroxide / $\mathrm{NaOH} /$ alkaline solution

II this would give a white precipitate with aqueous silver nitrate / a source of chloride ions

III the precipitate is not completely soluble in dilute aqueous ammonia / the precipitate is soluble in concentrated aqueous ammonia
(b) (i) The sample would give a (broad) signal at $2500-3550 \mathrm{~cm}^{-1}$ characteristic of the O-H bond (1) accept answers based on $\mathrm{C}-\mathrm{O}$
(ii) Both molecules possess van der Waals forces (1)

Both molecules possess dipole-dipole forces (1) e.g. $\mathrm{C}^{\delta+}-\mathrm{Br}^{\delta-}$ or $\mathrm{C}^{\delta+}-\mathrm{OH}^{\delta-}(1)$
But-2-en-1-ol has hydrogen bonding and the bromo compound does not (1)
Hydrogen bonding is stronger than other intermolecular forces (1) therefore more energy is needed to separate the molecules (1)

## (QWC)Ensure that text is legible and that spelling, punctuation and grammar are accurate so that the meaning is clear <br> Select and use a form and style of writing appropriate to purpose and to complex subject matter

9. (a) (i) lone pair / bonding pair repulsion is greater than bonding pair / bonding pair repulsion
(ii) nitrogen and hydrogen have different electronegativities (1)
and this results in polarity / unequal electron distribution in the bond (1)
(b) (i) e.g.

equation using displayed formulae
ethane named (1)
(ii) e.g. spectacle frames / teeth brace
(iii) $109^{\circ} 28^{\prime} / 1091^{1 / 2} / ~ 109^{\circ}$
(c) (i) $60-70$ atmospheres
(ii) I e.g. $\mathrm{Al}_{2} \mathrm{O}_{3}$ / porous pot / concentrated sulphuric acid / concentrated phosphoric acid

II elimination / dehydration
(d) (i)

(ii) e.g. refrigerants / dry cleaning / solvents / pesticides / polymers
(iii) Any TWO from:
the $\mathrm{C}-\mathrm{Br}$ bond is the weakest and this has the greatest effect on the ozone layer, seen in $\mathrm{CHClF}_{2}$ (0.05) and $\mathrm{CBrClF}_{2}$ (10)
increasing numbers of $\mathrm{C}-\mathrm{Cl}$ bonds increase the RODP effect
there is a marked increase in effect when going from 1 chlorine atom in a molecule to 2 chlorine atoms
there is not such a marked change in effect when going from 2 chlorine atoms in a molecule to 3 chlorine atoms
the $\mathrm{C}-\mathrm{F}$ bond is the strongest and does not cause destruction of the ozone layer / has little effect on the ozone layer
