1410U40-1

## CHEMISTRY – A2 unit 4 Organic Chemistry and Analysis

TUESDAY, 12 JUNE 2018 - AFTERNOON

1 hour 45 minutes

Section A
Section B

For Examiner's use only			
Question	Maximum Mark	Mark Awarded	
1. to 5.	10		
6.	14		
7.	14		
8.	14		
9.	14		
10.	14		
Total	80		

### **ADDITIONAL MATERIALS**

In addition to this examination paper, you will need a:

- calculator:
- Data Booklet supplied by WJEC.

#### **INSTRUCTIONS TO CANDIDATES**

Use black ink or black ball-point pen. Do not use gel pen or correction fluid.

Write your name, centre number and candidate number in the spaces at the top of this page.

**Section A** Answer **all** questions in the spaces provided.

**Section B** Answer **all** questions in the spaces provided.

Candidates are advised to allocate their time appropriately between **Section A (10 marks)** and **Section B (70 marks)**.

## **INFORMATION FOR CANDIDATES**

The number of marks is given in brackets at the end of each question or part-question.

The maximum mark for this paper is 80.

Your answers must be relevant and must make full use of the information given to be awarded full marks for a question.

The assessment of the quality of extended response (QER) will take place in **Q.9**(a).

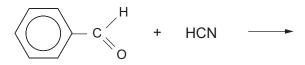

If you run out of space, use the additional page(s) at the back of the booklet, taking care to number the question(s) correctly.

#### **SECTION A**

Answer all questions in the spaces provided.

**1.** (a) Complete the equation below, which shows the reaction of benzaldehyde with hydrogen cyanide. [1]

- (b) Give the **formula** of the nucleophile that takes part in the reaction shown in part (a). [1]
- 2. Decarboxylation occurs when a carboxylic acid is heated with sodalime.

State the name of the carboxylic acid that will produce propane when strongly heated with sodalime. [1]

.....

3. Ammonia is produced when an amide is heated with aqueous sodium hydroxide.

O C 
$$-R-C$$
 +  $2NaOH$   $\longrightarrow$   $NH_2$  +  $2NaOH$   $\longrightarrow$   $Na^-O$   $C-R-C$   $O^-Na^+$  +  $2NH_3$  amide  $T$ 

In an experiment 3.90 g of the aliphatic amide  $\mathbf{T}$  gave 0.060 mol of ammonia. Use this information to find the formula of the hydrocarbon group R, present in the amide  $\mathbf{T}$ . [2]

Formula .....

[1]

PMT

4. (a) In acid solution the formula of the ion formed from phenylalanine is

Give the formula of the ion formed from phenylalanine in basic solution.

The melting temperatures of four compounds are shown in the table.

Compound	Melting temperature / °C
CH <sub>3</sub> CH <sub>2</sub> COOH	-21
CH <sub>3</sub> CH(OH)COOH	18
CH <sub>3</sub> CHBrCOOH	26
CH <sub>3</sub> CH(NH <sub>2</sub> )COOH	289

Explain why the melting temperature of 2-aminopropanoic acid is very much higher than the other acids in the table. [2]

(b)

**PMT** 

**5.** On detonation, the explosive RDX produces carbon monoxide, steam and nitrogen.

$$C_3H_6N_6O_6(s)$$
  $\longrightarrow$   $3CO(g) + 3H_2O(g) + 3N_2(g)$ 

RDX *M*<sub>r</sub> 222

Calculate the mass of RDX that would give 1.00 m³ of gaseous products measured at 100 °C and at 1 atm. Give your answer to an **appropriate** number of significant figures. [2]

(1 mol of any gas occupies a volume of 30.6 dm<sup>3</sup> under these conditions)

Mass of RDX = .....g

PMT

### **SECTION B**

Answer all questions in the spaces provided.

**6.** (a) Oct-1-en-3-ol is a compound that attracts biting insects such as mosquitoes. It is contained in human breath and sweat and is also produced by some mushrooms.

A sequence of reactions starting with oct-1-en-3-ol is shown below.

PMT

$\overline{}$	
0	
4	
$\supset$	
0	
$\overline{}$	
4	1
$\overline{}$	

(i)	Give the molecular formula of oct-1-en-3-ol.
(ii)	State a reagent that can be used for Stage 2 and name the type of reaction mechanism taking place.
	Reagent(s)
	Type of reaction mechanism
(iii)	State a reagent that can be used for Stage 3. [
	isomer of oct-1-en-3-ol was reacted with alkaline iodine and produced a yello cipitate.
(i)	Give the formula of the yellow precipitate.
(ii)	Suggest a structural formula for this isomer and identify the group that enables it produce this yellow precipitate.
	Group
c) Octa	ane-2,3-dione is a pale yellow liquid and octane-2,3-diol is a colourless material.
(i)	State a reagent that can be used to produce octane-2,3-diol from octane-2,3-dion [
(ii)	Suggest how the rate of the reaction in part (i) could be studied.
······	

Turn over.

xaminer
only

(d) The mass spectrum of octane-2,3-dione ( $M_{\rm r}$  142) shows fragmentation peaks at m/z 99, 71 and 43.

Identify the species responsible for these peaks.	[2]

(e) Oct-1-en-3-ol is formed biochemically by the breakdown of linoleic acid.

The carbon to carbon double bonds in linoleic acid are reduced by hydrogen and the resulting product can then be reduced by another suitable reducing agent to give a compound of formula  $C_{18}H_{38}O$ .

(i) Write the **skeletal** formula of this compound. [2]

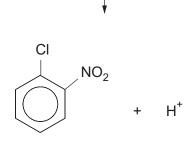

(ii) State the name of the reducing agent used in the second stage of the reduction. [1]

PMT

7. (a) 2,4-Dinitrophenylhydrazine (2,4-DNPH) can be made by the following route.

(i) Complete the mechanism for this reaction, which shows the nitration of chlorobenzene. You should use curly arrows and also show the structure of the intermediate. [2]

(ii) State the type of mechanism occurring in this nitration. [1]

(b) State the feature of 2,4-DNPH that enables it to react as a base. [1]

(c) 2,4-DNPH can be used as a reagent to identify aldehydes and ketones.  (i) State what is seen when 2,4-DNPH is used to identify an aldehyde or a ketone. [1]  (ii) Explain why 2,4-DNPH is an appropriate reagent to use in their identification. [1]  (d) Alternative reagents can be used for this identification. One of them is hydroxylamine, NH <sub>2</sub> OH, which produces a white crystalline solid when it reacts with an aldehyde or ketone.  For example with diphenylmethanone $ C_6H_5 C=O+NH_2OH C_6H_5 C=N-OH+H_2O C_6H_5 C_6H_5 C=N-OH+H_2O C_6H_5 C_6H_5 C=N-OH+H_2O C_6H_5 C_6H_5 C_6H_5$		
(ii) Explain why 2,4-DNPH is an appropriate reagent to use in their identification. [1]  (d) Alternative reagents can be used for this identification. diphenylmethanone oxime

N-phenylbenzamide

Describe how the infrared absorption spectra of these two compounds would differ, giving the relevant bonds and their wavenumbers. You should comment on **both** compounds when considering differences. [3]

**8.** (a) For a number of years CFCs were used in refrigeration and in air conditioning. The use of these compounds is in decline as they damage the ozone layer. A typical CFC is chlorotrifluoromethane.

Give an equation that shows the formation of a chlorine radical from chlorotrifluoromethane. [1]

(b) CFCs are being replaced by hydrofluorocarbons (HFCs) such as difluoromethane, which can be made by the reaction of dichloromethane with hydrogen fluoride in the presence of a catalyst.

$$CH_2CI_2 + 2HF \longrightarrow CH_2F_2 + 2HCI$$

One problem with this reaction is that chlorofluoromethane is also produced.

The table below shows the percentage of the organic products formed (and unreacted dichloromethane) for various starting ratios of the reactants.

Mole ratio	Percentage composition of mixture / %		
HF: CH <sub>2</sub> Cl <sub>2</sub>	CH <sub>2</sub> Cl <sub>2</sub>	CH <sub>2</sub> CIF	CH <sub>2</sub> F <sub>2</sub>
26 : 1	1.5	6.5	92.0
22 : 1	1.8	10.2	88.0
19 : 1	3.0	11.0	86.0
16 : 1	4.5	11.5	84.0

PMT

(i)	Write a statement that links the mole ratio of HF: CH <sub>2</sub> Cl <sub>2</sub> with the yield of difluoromethane. [1]
(ii)	In an experiment using 0.040 mol of $\mathrm{CH_2Cl_2}$ , the yield of $\mathrm{CH_2F_2}$ was 89.0%. Calculate the mass of difluoromethane produced. [2]
	Mass = g

(c) 1,1,1,2-Tetrafluoroethane is an HFC that is made from trichloroethene and hydrogen fluoride in a two-stage vapour phase process.

Stage 1 – an exothermic process

Stage 2 – an endothermic process

(i) Suggest, giving a reason, whether a high or low pressure should be used in **stage 1**. [1]

(ii) Suggest, giving a reason, whether a high or low temperature should be used in stage 2. [1]

© WJEC CBAC Ltd.

Examiner

[1]

The boiling temperatures of the organic products formed after each stage are (iii) shown below.

Compound	Boiling temperature / °C
1,1,1-trifluoro-2-chloroethane	7
1,1,1,2-tetrafluoroethane	-26

The final product tends to be contaminated with some of the chlorocompound formed in the first stage.

State the name of the method that can be used to separate these two	compounds
and suggest how this could be carried out in practice.	[2]

The use of HFCs is now declining as these compounds are contributing to global warming. (d) Compounds such as HFOs (hydrofluoroolefins) are under development as suitable replacements. One such HFO is 1,3,3,3-tetrafluoropropene.

(i)	Explain why 1,3,3,3-tetrafluoropropene exists as <i>E/Z</i> isomers.	[1]
•••••		•••••

Exar		
or	The addition of hydrogen bromide to 1,3,3,3-tetrafluoropropene results in two structural isomers, each of molecular formula $\rm C_3H_3BrF_4$ .	(ii)
	I. State the type of mechanism occurring in this reaction. [1]	
	These two compounds are formed in approximately equal amounts in this reaction.	
	Suggest why this ratio is different to that found in the reactions of other alkenes. [1]	
	Both the compounds formed in part (ii) will rotate the plane of plane polarised light.	(iii)
	Give the formula of <b>both</b> compounds indicating the chiral centre in both. [2]	
	Draw the two mirror image forms of the compound 1-bromo-1,2-difluoroethane. CHBrFCH $_2$ F. [1]	(iv)

**9.** (a) A solid compound is believed to be the herbicide 2,4-dichlorophenoxyethanoic acid (2,4-D).

The following results were obtained when this compound was analysed.

- The percentage by mass of chlorine present was 32.1
- A solution of the compound reacted with sodium hydrogencarbonate to give a colourless gas
- 4.09 g of the compound was dissolved in a suitable solvent and the solution made up to 250 cm<sup>3</sup>. A 25.0 cm<sup>3</sup> sample of this solution reacted with 24.70 cm<sup>3</sup> of aqueous sodium hydroxide of concentration 0.0750 mol dm<sup>-3</sup>
- Refluxing a sample of the compound with aqueous sodium hydroxide did **not** show the presence of chloride ions in the resulting mixture
- The compound did **not** react with aqueous bromine to give a white precipitate or to decolourise the bromine
- The simplified <sup>1</sup>H NMR spectrum of the compound showed three separate peaks having the area ratio 1:2:3
- The <sup>13</sup>C NMR spectrum of the compound showed eight peaks

(e) Polyesters can be made from a dicarboxylic acid and a diol, such as ethane-1,2-diol.

polyester E

- (i) State the name of the dicarboxylic acid that reacts with ethane-1,2-diol to give polyester **E**. [1]
- (ii) Complete the table to describe the high resolution <sup>1</sup>H NMR spectrum of polyester E.
   [3]

Protons	Splitting pattern	Relative peak area
—CH <sub>2</sub> —CH <sub>2</sub> —		
—CH—		
—CH <sub>3</sub>
