| Mark <br> Range | The marking scheme for this part of the question includes an overall <br> assessment for the Quality of Written Communication (QWC). There <br> are no discrete marks for the assessment of QWC but the <br> candidates' QWC in this answer will be one of the criteria used to <br> assign a level and award the marks for this part of the question <br> Descriptor |
| :---: | :--- |
| an answer will be expected to meet most of the criteria in the level |  |
| descriptor |  |$|$

(b) The higher the temperature the faster the reaction QWC
but, since the reaction is exothermic
the equilibrium yield is lower QWC

The higher the pressure the greater the equilibrium yield QWC
because there is a reduction in the number of moles of gas in the reaction
but higher pressure is expensive to produce or plant is more expensive to build QWC

A better catalyst would lessen the time to reach equilibrium
and allow more ammonia to be produced in a given time QWC
