

## Mark scheme

Question			Answer/Indicative content	Marks	Guidance																
1		i	$\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + \text{e}^- \checkmark$ <p><b>OR</b> <math>\text{Fe}^{2+} - \text{e}^- \rightarrow \text{Fe}^{3+}</math></p> $\text{C}_2\text{O}_4^{2-} \rightarrow 2\text{CO}_2 + 2\text{e}^- \checkmark$ <p><b>OR</b> <math>\text{C}_2\text{O}_4^{2-} - 2\text{e}^- \rightarrow 2\text{CO}_2</math></p>	2	<p>For both half-equations,</p> <p><b>ALLOW</b> multiples  <b>ALLOW</b> e for e<sup>-</sup>  <b>IGNORE</b> state symbols.</p> <p><b>ALLOW</b> <math>\text{C}_2\text{O}_4^{2-} \rightarrow \text{C}_2\text{O}_4^- + \text{e}^-</math>  <math>\text{C}_2\text{O}_4^{2-} \rightarrow \text{C}_2\text{O}_4 + 2\text{e}^-</math>  <math>2\text{H}_2\text{O} + \text{C}_2\text{O}_4^{2-} \rightarrow 2\text{CO}_3^{2-} + 4\text{H}^+ + 2\text{e}^-</math>  <b>ALLOW</b> <math>2\text{C}_2\text{O}_4^{2-} \rightarrow \text{C}_4\text{O}_8^{2-} + 2\text{e}^-</math></p> <p><b>Examiner's Comments</b></p> <p>Most candidates were given a mark for one of their half-equations.</p> <p>The half-equation for the oxidation of iron(II) ions was correct more often than that for ethanedioate ions. Strangely, a significant number of half-equations started with Fe metal instead of Fe<sup>2+</sup> ions. The mark scheme allowed for variations in the oxidation of ethanedioate ions, with several alternative equations being given from the correct equation forming CO<sub>2</sub> receiving a mark.</p>																
		ii	<table border="1"> <thead> <tr> <th></th> <th>1</th> <th>2</th> <th>3</th> </tr> </thead> <tbody> <tr> <td>Final reading/ cm<sup>3</sup></td> <td>23.55</td> <td>45.40</td> <td>22.75</td> </tr> <tr> <td>Initial reading/ cm<sup>3</sup></td> <td>1.90</td> <td>23.55</td> <td>1.20</td> </tr> <tr> <td>Titre / cm<sup>3</sup></td> <td>21.65</td> <td>21.85</td> <td>21.55</td> </tr> </tbody> </table>		1	2	3	Final reading/ cm <sup>3</sup>	23.55	45.40	22.75	Initial reading/ cm <sup>3</sup>	1.90	23.55	1.20	Titre / cm <sup>3</sup>	21.65	21.85	21.55	3	<p><b>Examiner's Comments</b></p> <p>Most candidates were given all 3 marks for their titration tables. One mark was allocated to the readings, the other 2 for the correct titres.</p> <p>Candidates are expected to record burette readings to 2 decimal places with the last figure being 0 or 5, reflecting the accuracy of the burette, which is stated in the question. Two issues were seen:</p>
	1	2	3																		
Final reading/ cm <sup>3</sup>	23.55	45.40	22.75																		
Initial reading/ cm <sup>3</sup>	1.90	23.55	1.20																		
Titre / cm <sup>3</sup>	21.65	21.85	21.55																		

		<p><b>Readings recorded to accuracy of burette</b></p> <p>All readings recorded to <b>two decimal places</b> with the last figure either <b>0</b> or <b>5</b>  <b>AND</b>  Final and initial readings in correct rows ✓</p> <p><b>Correct titres</b></p> <p>All 3 titres correct to 2 DP: ✓✓  2 titres correct to 2 DP: ✓</p>		<ul style="list-style-type: none"> <li>Some candidates ignored the terminal 0 in their readings, e.g. 1.9 for 1.90 cm<sup>3</sup>.</li> <li>A small number of candidates recorded the initial and final readings the wrong way round despite these terms being used above each burette diagram.</li> </ul> <p>Titres were usually correct.</p>
	iii	<p><b>FIRST, CHECK THE ANSWER ON ANSWER LINE</b>  <b>IF % error = 0.46, award 1 mark</b></p> <p>-----</p> <p><math>\frac{2 \times 0.05}{21.65} \times 100 = 0.46 (\%) \checkmark</math>      2 DP minimum  <i>Calculator value: 0.46189...</i></p>	1	<p><b>Check Titres from 3b(ii) at top of response</b></p> <p>-----</p> <p><b>ALLOW</b> % error from <b>ANY</b> of the 3 titres from <b>3b(ii)</b>  <b>OR</b> from the mean titre</p> <p><b>DO NOT ALLOW</b> 0.50%</p> <p><b>Examiner's Comments</b></p> <p>Candidates are much better at calculating percentage uncertainties than in previous series.</p> <p>Almost all candidates realised that the uncertainty in the titre resulted from two readings and that the overall uncertainty in the titre would be <math>2 \times 0.05 = 0.1 \text{ cm}^3</math>, resulting in a percentage uncertainty of 0.46%. Comparatively few candidates ignored the '2' and gave 0.23% as their answer.</p> <p>Some candidates worked out the percentage uncertainty from the mean titre but this was still given marks.</p>
	iv	<p><b>Level 3 (5-6 marks)</b>  Analyses the results to calculate the <b>correct</b> amount of MnO<sub>4</sub><sup>-</sup> using the <b>correct</b> mean titre from the candidate's titres  <b>AND</b></p>	6	<p><b>*For mean titre, Check Titres from 3b(ii) at top of response*</b></p> <p><b>Indicative scientific points may include:</b></p>

Obtains **correct** value of **x as 2**  
*There is a well-developed line of reasoning which is clear and logically structured.*  
*The information presented is relevant and substantiated.*

### Level 2 (3-4 marks)

Analyses titration results to determine an amount of  $\text{MnO}_4^-$  from a mean titre of the candidate's titres

#### AND

amount of  $\text{FeC}_2\text{O}_4$  in  $25.0 \text{ cm}^3$  OR  $250 \text{ cm}^3$

#### OR

uses a mass of  $\text{FeC}_2\text{O}_4$  to obtain a value of **x** with few errors

*There is a line of reasoning presented with some structure.*

*The information presented is relevant and supported by some evidence.*

### Level 1 (1-2 marks)

Analyses results to determine an amount of  $\text{MnO}_4^-$  from the candidate's titres

#### OR

Analyses the information to obtain values of  $n(\text{MnO}_4^-)$  and  $n(\text{FeC}_2\text{O}_4)$  with some errors.

*There is an attempt at a logical structure with a line of reasoning.*

*The information is in the most part relevant.*

**0 marks** - No response or no response worthy of credit.

### Mean titre and $n(\text{MnO}_4^-)$

$$\text{Mean titre} = \frac{(21.65 + 21.55)}{2} = 21.6(0) \text{ (cm}^3\text{)}$$

$$n(\text{MnO}_4^-) = 0.0200 \times \frac{21.6(0)}{1000} = 4.32 \times 10^{-4} \text{ (mol)}$$

### Amount of $\text{FeC}_2\text{O}_4$ in mol

$$\begin{aligned} n(\text{FeC}_2\text{O}_4) \text{ in } 25.0 \text{ cm}^3 &= 5/3 \times n(\text{MnO}_4^-) \\ &= 7.2(0) \times 10^{-4} \text{ (mol)} \end{aligned}$$

$$n(\text{FeC}_2\text{O}_4) \text{ in } 250 \text{ cm}^3 = 7.2(0) \times 10^{-3} \text{ (mol)}$$

### Value of x (final answer)

$$\begin{aligned} \text{Molar mass } \text{FeC}_2\text{O}_4 \cdot x\text{H}_2\text{O} &= \frac{1.295}{7.2(0) \times 10^{-3}} \\ &= 179.9 \end{aligned}$$

$$\text{Molar mass of } x\text{H}_2\text{O} = 179.9 - 143.8 = 36.(\dots)$$

$$x = 36/18 = 2$$

### Credit other correct methods,

e.g. For value of **x**

$$\begin{aligned} \text{Mass of } \text{FeC}_2\text{O}_4 &= 7.2(0) \times 10^{-3} \times \\ &143.8 = 1.03536 \text{ g} \end{aligned}$$

$$\begin{aligned} \text{Mass of } \text{H}_2\text{O} &= 1.295 - 1.035 = \\ &0.25964 \text{ g} \end{aligned}$$

$$n(\text{H}_2\text{O}) = \frac{0.25964}{18} = 0.0144 \text{ mol}$$

$$x = \frac{0.0144}{7.2 \times 10^{-3}} = 2$$

Responses using  $25.0 \text{ cm}^3$  rather than the titres are limited to **Level 1**

For communication, a typical 'logical structure' would label most calculation steps in response

e.g.

*Communication strand met*

$$\begin{aligned} \text{KMnO}_4 \text{ mean titre: } &\frac{21.65 + 21.55}{2} = 21.6 \text{ cm}^3 \\ \text{or } n(\text{KMnO}_4) &= \frac{21.6 \times 10^{-3}}{1000} \times 0.02 \\ &= 4.32 \times 10^{-4} \\ n(\text{FeC}_2\text{O}_4 \cdot x\text{H}_2\text{O}) &= \frac{4.32 \times 10^{-4}}{3} \times 5 \\ &= 7.2 \times 10^{-4} \text{ in } 25 \text{ cm}^3 \\ n &= 7.2 \times 10^{-3} \text{ in } 250 \text{ cm}^3 \\ n &= \frac{\text{mass}}{\text{M}} \\ \text{Molar mass} &= \frac{1.295}{7.2 \times 10^{-3}} = 179.98 \end{aligned}$$

*Communication strand not met*

$$\frac{21.60}{1000} \times 0.02 = 4.32 \times 10^{-4} \text{ mol}$$

$$\left( \frac{4.32 \times 10^{-4}}{3} \right) \times 5 = 7.2 \times 10^{-4} \text{ mol in } 25 \text{ cm}^3$$

$$(7.2 \times 10^{-4}) \times 10 = 7.2 \times 10^{-3} \text{ mol in } 250 \text{ cm}^3$$

$$\frac{1.295}{7.2 \times 10^{-3}} = 179.86$$

### **Examiner's Comments**

This unstructured titration problem was assessed by Level of Response (LOR).

Candidates answered this stock titration calculation well. The key stages are listed below:

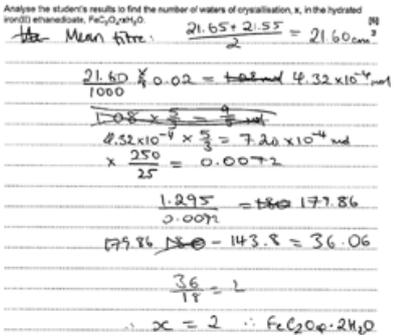

1. Determination of the mean titre from the two closest titres in the candidate's response to Question 3 (b) (ii). If the titres were correct, this would be 21.60 cm<sup>3</sup>, the mean of 21.55 cm<sup>3</sup> and 21.65 cm<sup>3</sup>.
2. Calculation of the number of moles of MnO<sub>4</sub><sup>-</sup> as 4.32 × 10<sup>-4</sup> mol. Calculation of the number of moles of FeC<sub>2</sub>O<sub>4</sub> in 25 cm<sup>3</sup> as 5/3 × 4.32 × 10<sup>-4</sup> = 7.20 × 10<sup>-4</sup> mol.
3. Scaling up this number of moles by 10 for the moles in 250 cm<sup>3</sup> as 7.20 × 10<sup>-3</sup> mol.
4. Determination of the number of waters of crystallisation.

Most candidates completed Stages 1 and 2 correctly, securing a minimum of a Level 1 response.

A significant number of candidates then completed Stage 3, with most including scaling by 10 to secure a minimum of Level 2.

Many of these candidates compared the moles of FeC<sub>2</sub>O<sub>4</sub> to the mass of FeC<sub>2</sub>O<sub>4</sub>·xH<sub>2</sub>O used to determine the value of x as 2. Such candidates would have reached Level 3.

The communication strand of the LOR mark was determined by the

				<p>clarity of the response, particularly whether the numbers in the calculation had been labelled. Unfortunately, many 'correct' responses had not done this. Over half the candidates were given 5 or 6 marks for this stock calculation.</p> <p><b>Exemplar 2</b></p>  <p>This exemplar demonstrates the hazards of not communicating well.</p> <p>The candidate has followed the four stages described above and the chemistry behind the titration analysis is correct. However, the response is mostly a page of numbers, with no explanation about what the numbers mean.</p> <p>The response is clearly at Level 3 but it is impossible to credit the communication strand, receiving a total of 5 marks.</p>	
			<b>Total</b>	<b>12</b>	
2	i	$4\text{PH}_3 + 8\text{O}_2 \rightarrow \text{P}_4\text{O}_{10} + 6\text{H}_2\text{O} \checkmark$		1	<p><b>ALLOW</b> multiples</p> <p><b>ALLOW</b> <math>2\text{PH}_3 + 4\text{O}_2 \rightarrow \text{P}_2\text{O}_5 + 3\text{H}_2\text{O}</math></p> <p><b>IGNORE</b> state symbols, even if wrong</p> <p><b>Examiner's Comments</b></p> <p>Candidates found this question quite challenging, with only about one-third writing a correct equation. The question gave the reactants and products with only the formula of phosphorus(V) oxide having to be worked out.</p>

				<p>The actual reaction does produce <math>P_4O_{10}</math> but <math>P_2O_5</math> was shown in almost all equations, and this was acceptable.</p> <p>Various incorrect formulae were seen for phosphorus(V) oxide including PO, <math>PO_2</math>, <math>P_5O</math>, HPO, etc. Unfortunately a significant number of candidates could not balance the equation, despite using correct formulae.</p>
		ii	<p><math>6AgNO_3 + (1)PH_3 + 3H_2O \rightarrow 6Ag + (1)H_3PO_3 + 6HNO_3 \checkmark</math></p> <p>Ag is reduced from +1 to 0 <math>\checkmark</math></p> <p>P is oxidised from -3 to +3 <math>\checkmark</math></p> <p><b>IGNORE</b> oxidation numbers written around equation <i>Treat as rough working</i></p> <p><b>IGNORE</b> reference to electrons <i>Question states oxidation numbers</i></p>	<p><b>ALLOW</b> equation with '1' omitted, i.e. <math>6AgNO_3 + PH_3 + 3H_2O \rightarrow 6Ag + H_3PO_3 + 6HNO_3 \checkmark</math> <b>BUT DO NOT ALLOW</b> '0'</p> <p><b>ALLOW</b> 1 mark for <b>BOTH</b> correct oxidation number changes with 'reduced' and 'oxidised' omitted</p> <p><b>OR</b> 'oxidised and reduced the wrong way round</p> <p>+ signs required for +1 and +3</p> <p>For oxidation numbers, <b>ALLOW</b> 1+, 3- and 3+</p> <p><b><u>Examiner's Comments</u></b></p> <p>This question generated a wide range of responses, testing many important chemical skills.</p> <p>Candidates often used oxidation numbers correctly to show that silver is reduced and phosphorus oxidised, with silver being the easier. Hydrogen was sometimes incorrectly chosen for oxidation.</p> <p>The oxidation number change of +1 to 0 for silver was usually correct although +9 and +11 were common errors for silver in <math>AgNO_3</math>, presumably by choosing the oxidation number of nitrogen as -3 or -5.</p> <p>Candidates usually recognised that phosphorus started with an oxidation</p>

				<p>number of -3 but the oxidation number of +5 was a common error in <math>\text{H}_3\text{PO}_3</math>.</p> <p>Balancing the equation was the most difficult part of this question with numbers being added almost at random. It is easier to balance equations for redox reactions by balancing the oxidation number changes first.</p> <p> <b>Assessment for learning</b></p> <p><math>\text{Ag}^+</math> and <math>\text{NO}_3^-</math> are among the common ions that students should know (see also Question 4 (c) (i)). For a <math>\text{NO}_3^-</math> ion to have a charge of 1-, the oxidation number of nitrogen must be +5. By choosing -5, the charge on <math>\text{NO}_3</math> would be -11 and silver would have an oxidation number of +11. This is completely unrealistic and should be rejected as it points to a serious error.</p> <p>The specification states the following: <i>2.1.5 (a) rules for assigning and calculating oxidation number for atoms in elements, compounds and ions.</i></p> <p>This section will have been studied at the start of the two-year course and forms part of the backbone of chemical literacy. For success in chemistry, the ions should be learnt and the rules for assigning oxidation numbers need to be mastered.</p>	
			<b>Total</b>	<b>4</b>

			<p>Standard conditions  <math>1 \text{ mol dm}^{-3}</math>  <b>AND</b>  Temperature: 298 K / 25 °C  <b>AND</b>  Pressure: 1 atm / 100 kPa/101 kPa ✓</p>		<p>H<sup>+</sup></p> <p><b><u>For standard conditions:</u></b></p> <p>Can be awarded if all quoted on standard condition line or in labelled diagram.</p> <p><b>ALLOW</b> 1M</p> <p><b>ALLOW</b> equimolar solutions for Fe<sup>2+</sup>  <b>AND</b> Fe<sup>3+</sup> only. i.e. need <math>1 \text{ mol dm}^{-3}</math> for [H<sup>+</sup>]</p> <p><b>IGNORE</b> H<sub>2</sub>SO<sub>4</sub> in diagram unless concentration is stated with a value other than <math>0.5 \text{ mol dm}^{-3}</math></p> <p><b>DO NOT ALLOW</b> if any concentration is incorrect</p> <p><b><u>Examiner's Comments</u></b></p> <p>Successful candidates drew a complete circuit and voltmeter with the labelled salt bridge dipped into the two solutions. Both cells had Pt as the electrodes. One cell contained <math>1 \text{ mol dm}^{-3}</math> Fe<sup>2+</sup> and Fe<sup>3+</sup> where the other had a delivery mechanism for H<sub>2</sub> (at 1 atm) and H<sup>+</sup> (at <math>1 \text{ mol dm}^{-3}</math>). Standard temperature of 298K (or 25°C) was stated.</p> <p>Common errors included: not have solutions in the beakers, used Fe or Fe<sup>2+</sup> electrodes, the hydrogen cell was missing and/or the H<sub>2</sub> with a device for adding it. A few candidates suggested two cells with only Fe<sup>2+</sup> one side and only Fe<sup>3+</sup> on the other.</p>
b	i		<p>Li + CoO<sub>2</sub> → LiCoO<sub>2</sub> ✓</p>	1	<p><b>ALLOW</b> ⇌</p> <p><b>DO NOT ALLOW</b> uncanceled species</p> <p><b><u>Examiner's Comments</u></b></p> <p>Most candidates were successful in constructing this equation. Common errors included the backwards reaction and some with unbalanced Li<sup>+</sup>. Candidates should also check</p>

				their equations, as a few included an erroneous C in the formula e.g. $\text{LiCoCO}_2$ .
		ii	<p><b>Cell potentials:</b></p> <p><math>(E^\ominus) = 1.23 - 0.00</math> <b>OR</b> <math>1.23</math> (V)  <b>OR</b> (redox system 6 – redox system 3) = <math>1.23</math> (V)</p> <p><b>AND</b></p> <p><math>(E^\ominus) = 0.40 - (-0.83) = 1.23</math> (V)  <b>OR</b> (redox system 4 – redox system 2) = <math>1.23</math> (V)</p> <p>✓</p> <p><b>Acidic</b>  <i>Cell equation</i></p> <p><math>(2\times) \text{H}_2 \rightleftharpoons 2\text{H}^+ + 2\text{e}^-</math>  <b>AND</b>  <math>\text{O}_2 + 4\text{H}^+ + 4\text{e}^- \rightleftharpoons 2\text{H}_2\text{O}</math>  <b>AND</b>  <math>2 \text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}</math> ✓</p> <p><b>Alkaline</b>  <i>Cell equation</i></p> <p><math>(2\times) \text{H}_2 + 2\text{OH}^- \rightleftharpoons 2\text{H}_2\text{O} + 2\text{e}^-</math>  <b>AND</b>  <math>\text{O}_2 + 2\text{H}_2\text{O} + 4\text{e}^- \rightleftharpoons 4\text{OH}^-</math>  <b>AND</b>  <math>2 \text{H}_2 + \text{O}_2 \rightarrow 2 \text{H}_2\text{O}</math> ✓</p>	<p><b>IGNORE</b> state symbols throughout</p> <p><b>ALLOW</b> multiples  <b>ALLOW</b> <math>\rightleftharpoons</math></p> <p>Overall equation  <b>AND</b></p> <p>with evidence of working:  e.g. half-equations written out / combined but not cancelled / with crossings out <b>OR</b> <u>System 6</u> goes forward / reduced <b>OR</b> <u>system 3</u> goes backwards / oxidised</p> <p><b>ALLOW</b> multiples  Overall equation  <b>AND</b></p> <p>with evidence of working:  e.g. half-equations written out / combined but not cancelled / with crossings out <b>OR</b> <u>System 4</u> goes forward / reduced <b>OR</b> <u>system 2</u> goes backwards oxidised</p> <p><b>ALLOW 1</b> mark for both equations with uncancelled species.</p> <p><b>ALLOW 1</b> mark for <u>System 6</u> / reduced goes forward and <u>system 3</u> goes backwards oxidised <b>AND</b> <u>System 4</u> / goes forward / reduced and <u>system 2</u> / goes backwards / oxidised</p> <p><b><u>Examiner's Comments</u></b></p> <p>Most candidates were able to successfully show the overall equations were the same. Most combined the two half equations and then cancelled down to give the overall equations. A few candidates chose to describe the redox nature or use the equilibrium shifts scoring the first 2 marks. Some candidates, incorrectly, deduced the equation as <math>\text{H}^+ + \text{OH}^- \rightarrow \text{H}_2\text{O}</math>. Some candidates gave the 1.23V value without showing</p>

					any calculation or did not refer to this part of the question at all. This was one of the most common questions where candidates omitted to provide a response on the paper.
			<b>Total</b>	<b>8</b>	
4	a	i	$\text{Au} + 4 \text{HCl} \rightarrow 4 \text{H}^+ + \text{AuCl}_4^- + 3 \text{e}^- \checkmark$	1 (AO 1.2)	<p><b>Examiner's Comments</b></p> <p>Most candidates added '4' before HCl/ and H<sup>+</sup>, and 3 before e<sup>-</sup> to gain this mark. Where an error was made, it invariably was with the number of electrons, usually 4e<sup>-</sup>.</p>
		ii	<p><b>Formulae</b></p> <p><b>X = NO</b> ✓</p> <p><b>Z = H<sub>2</sub>O</b> ✓</p> <p><b>Equation Independent from ID of X and Z</b></p> <p><math display="block">\text{HNO}_3 + 3 \text{H}^+ + 3 \text{e}^- \rightarrow \text{NO} + 2 \text{H}_2\text{O}</math></p> <p><b>OR</b></p> <p><math display="block">\text{NO}_3^- + 4 \text{H}^+ + 3 \text{e}^- \rightarrow \text{NO} + 2 \text{H}_2\text{O} \checkmark</math></p> <p><b>CHECK BELOW ANSWER SPACE FOR RESPONSE</b></p>	3 (AO 3.1 ×3)	<p>If <b>X</b> and <b>Z</b> in wrong order award 1 out of 2 formula marks i.e. <b>X</b> = H<sub>2</sub>O and <b>Z</b> = NO      1 mark</p> <p><b>ALLOW</b> multiples</p> <p><b>Examiner's Comments</b></p> <p>Almost all candidates identified <b>X</b> and <b>Y</b> as NO and H<sub>2</sub>O respectively, but the equation proved to be much more testing. Some candidates were careless, showing NO and H<sub>2</sub>O the wrong way round (credited with 1 out of these 2 marks) or with charges.</p> <p>For the equation, candidates needed to consider the oxidation number change of N from +5 to +2, This should have naturally led to 3e<sup>-</sup> being added on the left-hand side. Many candidates omitted the electrons entirely. Some did add 3e<sup>-</sup> but on the right. This suggests that candidates would benefit with practising the construction of half equations.</p>
	b		<p><b>Level 3 (5–6 marks)</b></p> <ul style="list-style-type: none"> <li>Reaches a comprehensive conclusion to determine all <b>three</b> correct formulae of <b>D, E AND F</b></li> </ul>	6 (AO 3.1 ×3) (AO 3.2 ×3)	<p><b>Indicative scientific points may include:</b></p> <p><b>Identify of D, E and F</b></p> <ul style="list-style-type: none"> <li><b>D:</b> NiSO<sub>4</sub>•6H<sub>2</sub>O <b>OR</b> NiSO<sub>4</sub>(H<sub>2</sub>O)<sub>6</sub> <b>OR</b> NiSO<sub>10</sub>H<sub>12</sub></li> </ul>

- **AND** constructs most equations with few errors

*There is a well-developed line of reasoning which is clear and logically structured.*

*The information presented is relevant and substantiated.*

### Level 2 (3–4 marks)

- Reaches a comprehensive conclusion to determine **two** correct formulae of **D, E AND F**
- **AND** constructs some equations with some errors

*There is a line of reasoning presented with some structure.*

*The information presented is relevant and supported by some evidence.*

### Level 1 (1–2 marks)

- Determines a correct formula for **one** of **D, E AND F**
- **AND** provides some evidence to support the formula

*There is an attempt at a logical structure with a line of reasoning. The information is in the most part relevant.*

**0 mark** *No response or no response worthy of credit.*

### Examiner's Comments

This level of response question required candidates to interpret three pieces of information to identify 3 unknown chemicals, linked by three reactions of sulfuric acid. Levels were assigned based on identifying the three unknowns and writing equations for the reactions. The 3 reactions were tiered in difficulty with the cyclic structure for compound **F** being the most difficult.

The question discriminated extremely well, with comparatively few candidates not scoring any marks.

### Exemplar 4

					<p>This exemplar shows an excellent response which was awarded Level 3 and 6 marks.</p> <p>The crossing out shows how the candidate progressively solved the problem. Despite the crossing out, working is shown throughout, and the presentation of the response is very clear.</p> <p>For reaction 1, the candidate initially made an error in the stock formula determination calculation. Notice that the candidate crossed out their initial values and wrote them afresh. This approach is recommended. as changing incorrect numbers can lead to ambiguous numbers.</p> <p>In reaction 2, the candidate comfortably identified compound <b>E</b> from its molar mass and wrote a balanced equation for this reaction.</p> <p>For reaction 3, you can see how the candidate's thought developed during the solve. They initially went for a straight chain structure and then worked out that there must be a cyclic structure. They finally show the cyclic diester as a conventional structural (based on glucose?), and with a balanced equation.</p> <p>This was an excellent response of a high-ability candidate and shows what a well-prepared candidate is capable of achieving.</p>

**63.36 mg** scaling by 250/150 → 3 marks

**Examiner's Comments**

This question was a standard titration calculation, set in a practical context. As with Question 6 (c) (i), this assessed one of the important principles encountered in A Level Chemistry. Success required three main stages:

- Calculation of the amount, in mol, of I<sub>2</sub> used in the titration of 25.0 cm<sup>3</sup> of the diluted orange juice.
- Determination of the amount in mol of vitamin C in the 250 cm<sup>3</sup> solution (effectively scaling by ×10)
- Use of this value with the molar mass of vitamin C to determination of the mass of vitamin C, in mg, in the 150 cm<sup>3</sup> serving of the orange juice.

Most candidates calculated the amount of I<sub>2</sub> (and vitamin C) in the titre as  $2.16 \times 10^{-5}$  mol. The next scaling stage by ×10 to  $2.16 \times 10^{-4}$  mol introduced a problem. Many candidates were distracted by the '150 cm<sup>3</sup>' serving of orange juice and they scaled further by a factor of 150/250 to give  $1.296 \times 10^{-4}$  mol.

Candidates scaling corrected by ×10 usually used the vitamin C molar mass of 176 g mol<sup>-1</sup> to determine the

					<p>correct mass of 38 mg in the orange juice serving.</p> <p>The common incorrect mass of 22.8 mg resulted from the extra scaling by 150/250 described above. This could still be given 3 of the available 4 marks as only one error had been made.</p> <p>Some candidates worked out an incorrect molar mass for vitamin C, with 174 often seen. Provided that this value was used with a correct method, ECF could still be applied for the final mass.</p>
