--	--	--	--	---

				<p>Many candidates showed excellent recall of how to determine the correct empirical formula from the percentage composition data. Most then went on to use the <math>m/z</math> peak on the mass spectrum to confirm that the <math>M_r</math> was 134, and therefore the molecular formula was identical to the empirical formula. A few also made use of the mass spectrum to identify possible fragment ions including a correct positive charge.</p> <p>Most candidates used the IR spectrum to identify a C=O bond and many also mentioned the absence of O-H or spotted C=C for arenes. Lower attaining candidates sometimes incorrectly mentioned the presence of a carboxylic acid O-H despite the molecular formula only having 1 oxygen atom.</p> <p>Many candidates annotated the NMR spectrum and/or presented their analysis clearly in a table format and were able to identify aldehyde and arene hydrogen environments. The best candidates had fragments built up alongside their NMR analysis clearly building them using chemical shift, integration ratios and splitting patterns. Those that struggled to interpret the splitting patterns correctly suggested incorrect structures but often with correct features so were still able to score Level 2, 4 marks. Some initially identified the multiplet peak at 3.8 ppm as being HC-O environment but many realised this did not fit the IR data. However, some changed other evidence to fit this, e.g. the peak at 9.0 ppm being an O-H rather than CHO and the IR having C=C only without C=O as well.</p> <p>A large proportion of candidates were able to correctly determine the structure of compound <b>J</b>, recognising that the peak at 3.8 ppm was shifted up-field as adjacent to both the benzene ring and the aldehyde group. The data sheet refers to this: 'CH bonded to 'shifting groups' on either side, e.g. O-CH<sub>2</sub>-C=O, may be shifted more than indicated above'.</p> <p>Several candidates who did not get the correct structure gave structures which were chemically unfeasible, e.g. with pentavalent carbons. Many candidates had several structures as part of working but did not</p>
--	--	--	--	---

always ensure their final structure was clearly highlighted.

A very small number of candidates received no credit for this question, as the majority were able to show analysis of 2 aspects, e.g. the calculation of empirical formula and labelling of IR or NMR spectra.

### Exemplar 3

Proton NMR spectrum of compound J

The numbers by the peaks are the relative peak areas.

4 proton env

Determine the structure of compound J, showing all your reasoning.

[6]

elemental analysis:

$$n(\text{C}) = \frac{80.60}{12} = 6.71667 = 9$$

$$n(\text{H}) = \frac{7.46}{1} = 7.46 = 10 \quad \text{C}_9\text{H}_{10}\text{O} = 134$$

$$n(\text{O}) = \frac{11.94}{16} = 0.74625 = 1$$

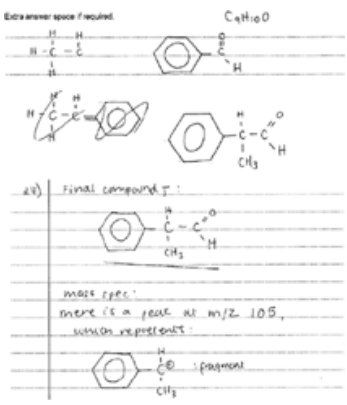

Infrared:

→ there is a peak at  $1700 \text{ cm}^{-1}$ , which represents  $\text{C}=\text{O}$  bond, which occurs between  $1630-1820 \text{ cm}^{-1}$  → aldehyde or ketone.

$^1\text{H}$  NMR:

	$\delta/\text{ppm}$	n of protons	splitting	n of protons on adjacent	Structure
①	1.5	3	doublet	1	$\text{H}_3\text{C}-\text{CH}$
②	3.8	1	multiplet	4	$\text{HC}-\text{CH}_2-\text{CH}_3$
③	7.3	5	doublet	0	$\text{C}_6\text{H}_5$
④	9.0	1	doublet	1	$-\text{C}(=\text{O})\text{H}$ (aldehyde)?

				<div><p>Extra answer space required.</p><p><math>C_9H_{10}O</math></p></div>
				<p>Level 3, 6 marks</p> <p>There is clear and detailed analysis throughout this response to determine the correct final structure for <b>J</b>. The empirical formula calculation shows how the empirical formula was determined. On the mass spectrum the annotation links to the <math>M_r</math> of 134 and at the end of the response they have identified the fragment responsible for the parent ion. The <math>C=O</math> IR peak is labelled and described in the response. The NMR analysis is clear, with each peak being numbered and linked to a table which shows how the candidate has identified the hydrogens responsible for each peak as well as linking to neighbouring hydrogens from splitting patterns. The final compound is labelled as such to distinguish it clearly from other structures given, which were part of their problem solving to find a structure that fits all of the analysis they had completed.</p>
			<b>Total</b>	<b>6</b>
2			<b>D</b>	<div><p><b>Examiner's Comments</b></p><p>Many missed the separate O–H in alcohol and O–H in carboxylic acid peaks as it is unusual to see clearly defined peaks for both in an IR spectrum. Those who got D tended to annotate the spectrum, noting the sharp peak as O–H bond, as well as drawing out structures for each option. A was the most common incorrect response. It is good to remind candidates to look at all possible options before making a final decision.</p></div>
			<b>Total</b>	<b>1</b>

3		<b>B</b>	1	<p><b>Examiner's Comments</b></p> <p>Around two-thirds picked the correct answer B, identifying Structures 1 and 2 as having 2 carbon environments. Most students labelled the carbon environments on the structures to help them. Candidates sometimes struggled to recognise the two different carbon environments within the benzene ring, in Structure 3, as well as the CH<sub>3</sub> group.</p>
		<b>Total</b>	<b>1</b>	
4		<p><b>Structures 1 mark</b></p> <p>CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH  <b>AND</b> CH<sub>3</sub>CH<sub>2</sub>CHOHCH<sub>3</sub>  <b>AND</b> (CH<sub>3</sub>)<sub>2</sub>CHCH<sub>2</sub>OH  <b>AND</b> (CH<sub>3</sub>)<sub>3</sub>COH ✓</p> <p><b>Number of peaks 3 marks</b></p> <p>CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH/ butan-1-ol <b>OR</b>  CH<sub>3</sub>CH<sub>2</sub>CHOHCH<sub>3</sub> / Butan-2-ol  have 4  peaks/environments/types of  carbon ✓</p> <p>(CH<sub>3</sub>)<sub>2</sub>CHCH<sub>2</sub>OH/ (2-  )methylpropan-1-ol has 3  peaks/environments/types of  carbon ✓</p> <p>(CH<sub>3</sub>)<sub>3</sub>COH/(2-)methylpropan-2-ol  has 2 peaks/environments/types of  carbon ✓</p> <p><b>Statement 1 mark</b></p> <p>(CH<sub>3</sub>)<sub>2</sub>CHCH<sub>2</sub>OH/ (2-  )methylpropan-1-ol can be  distinguished (from any other  isomer)  <b>OR</b>  (CH<sub>3</sub>)<sub>3</sub>COH/(2-)methylpropan-2-ol  can be distinguished (from any  other isomer)  <b>OR</b>  CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH/ butan-1-ol  <b>AND</b></p>	<p>5  (AO2.1)  (AO3.1  ×3)  (AO3.2  ×1)</p>	<p><b>ALLOW</b> any combination of skeletal <b>OR</b>  structural <b>OR</b> displayed formula as long as  unambiguous</p> <p><b>Note:</b> all 4 structures are needed for the mark.  Additional incorrect structures prevent this  mark being awarded.</p> <p><b>IGNORE</b> chemical shifts</p> <p><b>IGNORE</b> incorrect name if structure given</p> <p><b>ALLOW</b> correct number of peaks linked to an  incomplete structure e.g. C-C-C-C-OH has 4  peaks (no hydrogens shown)</p> <p><b>Statement mark can only be awarded if  candidate compares at least two isomers  and determines correct number of peaks  for the isomers referred to.</b></p> <p><b>DO NOT ALLOW ECF</b> from an incorrect  number of peaks/environments/types of  carbon</p> <p><b>Examiner's Comments</b></p> <p>This question discriminated well with a variety  of responses seen. The lower scoring  candidates gave vague answers suggesting  they did not fully grasp what the question was  asking. They often filled the lines with generic  responses in terms of what C NMR can do,  e.g. chemical shift data/shows positions of Cs  relative to OH group or number of peaks gives  number of environment but made no</p>

CH<sub>3</sub>CH<sub>2</sub>CHOHCH<sub>3</sub>/ butan-2-ol  
cannot be distinguished ✓

reference to the isomers mentioned in the question. For some there was obvious confusion with proton NMR due to discussion of splitting patterns or relative peak areas/heights. Lots struggled to find all four isomers, often repeating one they already had, but drawing them with a different layout, or by giving cyclic structures. Some struggled to count the correct number of peaks for each. It was common to see false equivalency between CH<sub>2</sub> groups, e.g. butan-2-ol with three peaks. Many struggled to give a concluding statement, often focusing more on slight differences in chemical shift due to proximity to OH group.

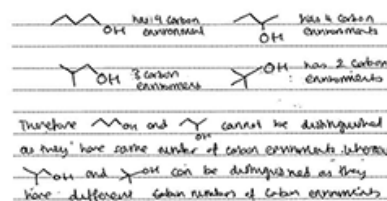

The highest scoring responses were well structured and started by identifying the four isomers. After stating the number of carbon environments for each isomer these responses often concluded with a statement detailing whether the isomers could be distinguished.

### Assessment for learning

Candidates often struggle with drawing out the different structural isomers. As a starter activity or plenary give candidates a molecular formula and challenge them to draw out all the different possible isomers. Using molymod can help candidates realise equivalent molecules. As candidates become more confident encourage them to draw structures using skeletal formula and to give the systematic names.

#### Exemplar 2

This candidate has clearly drawn out all four isomer structures and next to each has identified the number of carbon environments.

					They have then made a concluding statement using this information. This response scored all 5 marks.

				<p><b><u>Key features consistent with chemical shift data and relative peak areas</u></b></p> <ul style="list-style-type: none"> <li>• O-CH<sub>2</sub></li> <li>• C(CH<sub>3</sub>)<sub>3</sub></li> <li>• CH<sub>3</sub>CH<sub>2</sub>C=O</li> </ul> <p><b><u>Correct Structure</u></b></p> <ul style="list-style-type: none"> <li>• CH<sub>3</sub>CH<sub>2</sub>COOCH<sub>2</sub>C(CH<sub>3</sub>)<sub>3</sub></li> </ul> <div style="text-align: center;"> <math display="block">\text{CH}_3-\text{CH}_2-\overset{\text{O}}{\parallel}{\text{C}}-\text{O}-\text{CH}_2-\underset{\text{CH}_3}{\overset{\text{CH}_3}{\text{C}}}-\text{CH}_3</math> </div> <p><b><u>Examiner's Comments</u></b></p> <p>Most candidates were able to deduce the empirical and/or molecular formula of the organic compound. Analysis of the IR spectrum was also well attempted, but some candidates assumed the unknown was a carboxylic acid, attributing the sharp peak just below 3000 cm<sup>-1</sup> to an OH group. Others misidentified the C=O peak as a C=C group suggesting alkene or arene structure. They were often led to this conclusion as they believed no precipitate with 2,4-DNP suggested no C=O rather than no aldehyde or ketone.</p> <p>Good analysis of the NMR data was crucial for deducing the correct ester. Some candidates opted to annotate the proton NMR spectrum, some produced tables and others gave written details for each peak. It was vital that they were able to interpret all information for each peak i.e. number of proton environments, the type of environment from chemical shift, the number of protons in each environment from relative peak areas and use of splitting patterns to find information about adjacent protons. Many tried to make the data fit their proposed structure rather than the other way round. Some suggested structures that were only partially consistent with the data such as</p>
--	--	--	--	---

				<p>CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>COOC(CH<sub>3</sub>)<sub>3</sub> and were awarded Level 2. Others did not take full note of all the information provided, for example omitting the 2,4-DNP observations, giving the ketone (CH<sub>3</sub>)<sub>3</sub>COCH<sub>2</sub>COCH<sub>2</sub>CH<sub>3</sub> or not checking it matched the molecular formula CH<sub>3</sub>CH<sub>2</sub>COOC(CH<sub>3</sub>)<sub>3</sub> so only achieved Level 1.</p> <p>Candidates need to be encouraged to draw a structure as without they can only achieve a maximum of 2 marks despite some excellent analysis of the data. Conversely, it is not sufficient to just give a structure, candidates must give analysis of the data provided.</p> <p>Exemplar 3</p> <div><p><math>\delta</math> 6.4-6.5/12    <math>\delta</math> 4.18/1    <math>\delta</math> 2.18/36</p><p><math>\delta</math> 5.553    11.18    1.387</p><p>1.387    1.387    1.387</p><p><math>\delta</math> 4 : 8 : 1    empirical formula    C<sub>8</sub>H<sub>16</sub>O<sub>2</sub></p><p>Mr = 172</p><p><math>144/72 = 2</math> molecular formula = C<sub>8</sub>H<sub>16</sub>O<sub>2</sub></p><p>because Mr = 172 peak which is closest to 172.</p><p>IR spectrum: C=O peak at around 1700 cm<sup>-1</sup></p><p>C-O peak at around 1300 cm<sup>-1</sup></p><table><thead><tr><th>shift</th><th>proton type</th><th>relative peak area</th><th>splitting</th><th>no adjacent protons</th><th>deductions</th></tr></thead><tbody><tr><td>4.0</td><td>H<sub>2</sub>C-O</td><td>2</td><td>singlet</td><td>0</td><td>2 1 1</td></tr><tr><td>2.1</td><td>H<sub>2</sub>C<sup>o</sup></td><td>2</td><td>quartet</td><td>3</td><td>3 2 1</td></tr><tr><td colspan="6">Additional answer space required</td></tr><tr><td>1.1</td><td>H<sub>2</sub>C-R</td><td>3</td><td>triplet</td><td>2</td><td>2 1 1</td></tr><tr><td>0.9</td><td>H<sub>2</sub>C-R</td><td>9</td><td>singlet</td><td>0</td><td>3 3 3</td></tr></tbody></table><p>(continues on back page)</p><p>(13)</p><div><p>CH<sub>3</sub>    H    O    H    H</p><p>H<sub>2</sub>C = C - C = O - C - C - H</p><p>CH<sub>3</sub>    H    H    H    H</p><p>C<sub>8</sub>H<sub>16</sub>O<sub>2</sub></p></div></div>	shift	proton type	relative peak area	splitting	no adjacent protons	deductions	4.0	H <sub>2</sub> C-O	2	singlet	0	2 1 1	2.1	H <sub>2</sub> C <sup>o</sup>	2	quartet	3	3 2 1	Additional answer space required						1.1	H <sub>2</sub> C-R	3	triplet	2	2 1 1	0.9	H <sub>2</sub> C-R	9	singlet	0	3 3 3

**AND****Electrophilic attack 1 mark**Curly arrow from  $\pi$ -bond to  $\text{Cl}^+$   $\checkmark$ **Correct intermediate only 1 mark****Reforming benzene ring 1 mark**Curly arrow from C-H bond to reform  $\pi$ -ring  $\checkmark$ 

For curly arrows, **ALLOW** straight or snake-like arrows and small gaps (see examples):

1st curly arrow must

- start from, **OR** close to **circle of benzene ring**

**AND**

- go to  $\text{Cl}^+$

**DO NOT ALLOW** the following intermediate:

$\pi$ -ring must cover more than half of benzene ring

**AND**

correct orientation, *i.e.* gap towards C with Cl

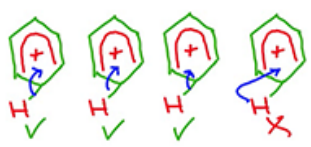

**ALLOW** + sign anywhere inside the 'hexagon' of intermediate

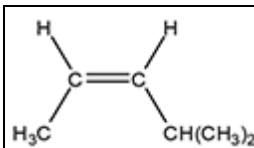

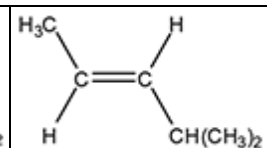

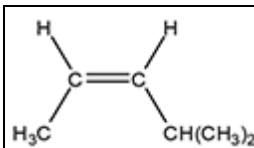

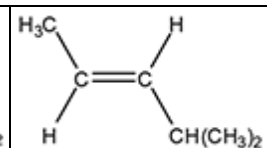

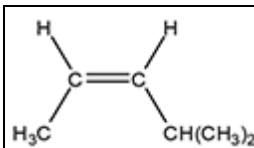

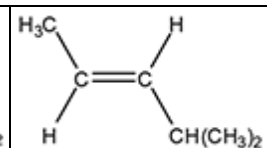

**DO NOT ALLOW** intermediates substituted at positions 3 or 5

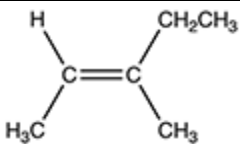

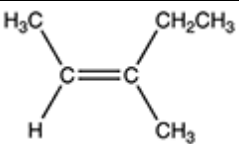

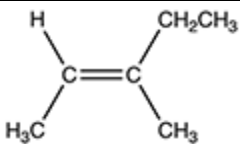

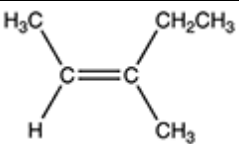

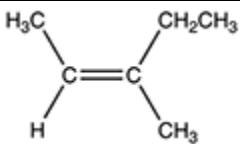

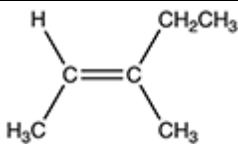

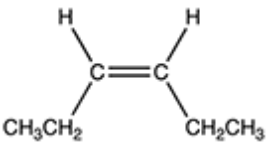

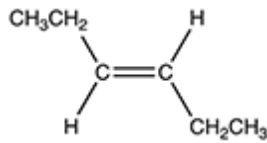

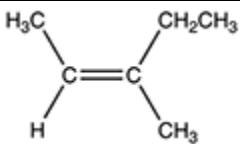

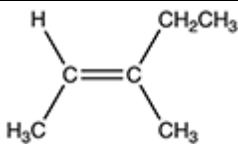

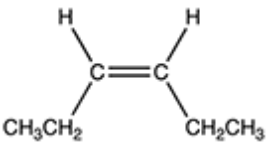

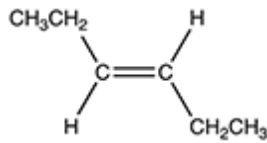

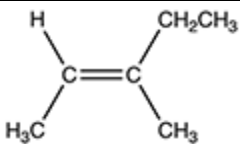

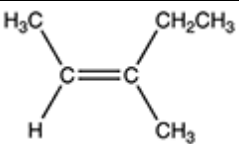

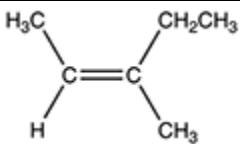

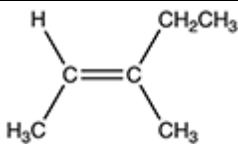

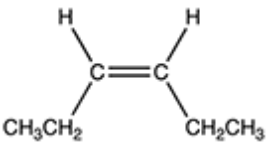

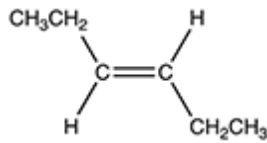

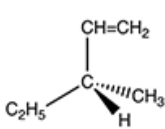

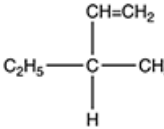

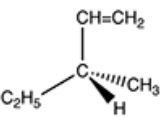

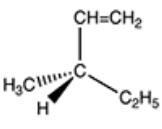

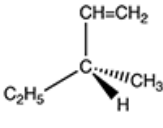

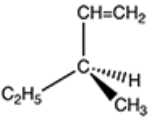

**IGNORE** intermediates substituted at position 2

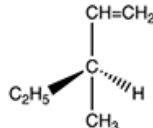

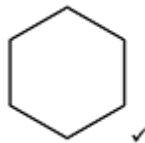

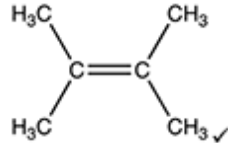

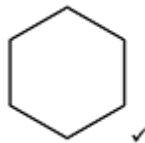

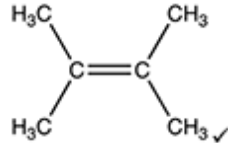

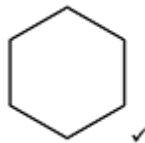

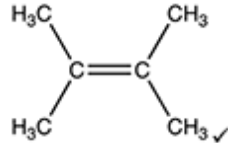

**OR** di-substituted at positions 2,4

Curly arrow must start from, **OR** be traced back to, **any part of C-H bond** and go inside the 'hexagon'

					 <p><b>Examiner's Comments</b></p> <p>Few candidates knew the test for a phenol group. Frequent incorrect responses involved the production of a gas with a carbonate or stating that bromine water is decolourised but failing to state that a white precipitate is also formed. A significant number of candidates also stated that the reaction with sodium hydroxide confirms the presence of the phenol group.</p> <p>This question proved challenging to candidates with few scoring all 3 marks. Where no marks were given, this was frequently because candidates did not state the number of carbon environments in compounds J, K and L. Candidates who were given 1 or two marks frequently stated the incorrect number of peaks that would be observed.</p> <p>This question required candidates to apply their knowledge of the mechanism of electrophilic substitution. Examiners were encouraged by the number of excellent responses to this question, with the majority of candidates securing 3 out of 4 marks. Common errors included the omission of HCl as product from the regeneration of the catalyst or candidates attempting to substitute at the 2 position.</p>
			<b>Total</b>	<b>8</b>

					<p><b>ALLOW</b> 1 mark for structures if shown in wrong boxes.</p> <p><b>CHECK</b> table 16.1 for annotations that may be worthy of credit</p> <p><b>Examiner's Comments</b></p> <p>The majority of candidates were able to correctly define a structural isomer.</p> <p>This definition was well known by candidates with the majority of responses given the mark. Some candidates omitted the reference to structural formula.</p> <p>This question required candidates to link their knowledge of <i>cis</i> and <i>trans</i> isomers with branched hydrocarbons. Higher ability candidates were able to do this. The majority of candidates scored 1 mark for correctly drawing <i>cis</i> and <i>trans</i> isomers of an unbranched hydrocarbon.</p> <p>This question discriminated well. Candidates were required to identify the groups around a chiral carbon. This question discriminated well. Candidates were required to identify the groups around a chiral carbon and then draw the two corresponding optical isomers. Incorrect responses frequently had incorrect connectivity around the chiral carbon, bond angles of 180° or 2D structures.</p> <p>Most candidates were able to correctly draw the structure of D and E. Many candidates did not explain their answers in terms of the number of different hydrogen and carbon</p>				
		v	<table border="1"> <tr> <td>  </td> <td>  </td> </tr> <tr> <td><b>D</b></td> <td><b>E</b></td> </tr> </table> <p>Two of the following for <b>D</b> ✓</p> <ul style="list-style-type: none"> <li>• All H are equivalent/in the same chemical environment/ the same type</li> <li>• All C are equivalent/ in the same chemical environment/ the same type</li> <li>• No C=C present</li> </ul> <p>Two of the following for <b>E</b> ✓</p> <ul style="list-style-type: none"> <li>• All H are equivalent/ in the same chemical environment/ the same type</li> <li>• 2 C environments</li> <li>• C=C present</li> </ul>			<b>D</b>	<b>E</b>	<p>4 (AO2.5×2) (AO2.2×2)</p>

13		i	<table border="1"><thead><tr><th>Proton environment</th><th>Splitting pattern</th><th></th></tr></thead><tbody><tr><td>1</td><td>Triplet</td><td>Triplet <b>AND</b></td></tr><tr><td>2</td><td>Quartet</td><td>quartet ✓</td></tr><tr><td>3</td><td>Doublet</td><td>Doublet <b>AND</b></td></tr><tr><td>4</td><td>Triplet</td><td>triplet ✓</td></tr></tbody></table>	Proton environment	Splitting pattern		1	Triplet	Triplet <b>AND</b>	2	Quartet	quartet ✓	3	Doublet	Doublet <b>AND</b>	4	Triplet	triplet ✓	<p>2 (2 ×AO1.2)</p>	<p><b>For quartet, ALLOW Quad....</b> e.g. <b>quadruplet, quadlet, quadret</b>, etc For doublet, <b>ALLOW</b> duplet <b>ALLOW</b> diagrams to show splitting pattern e.g.  for triplet  for quartet <b>ALLOW</b> splitting patterns shown as numbers i.e. '3' for triplet, '4' for quartet</p> <p><b><u>Examiner's Comments</u></b></p> <p>This question tested candidates' ability to predict splitting patterns of an organic compound in a proton NMR spectrum. The 2 marks were given for the interacting protons in environments 1 and 2, and in environments 3</p>
Proton environment	Splitting pattern																			
1	Triplet	Triplet <b>AND</b>																		
2	Quartet	quartet ✓																		
3	Doublet	Doublet <b>AND</b>																		
4	Triplet	triplet ✓																		

					and 4.  Most candidates predicted the correct triplet/quartet splitting pattern for the common $\text{CH}_3\text{CH}_2$ group. The splitting pattern for the less common $\text{CH}_2\text{CHO}$ was more difficult with many predicting at least one singlet. As with Question 1 (b) (ii), the second mark proved to be a very good discriminator.
		ii	<p><b>Environment 2:</b> (Protons) adjacent to (one) <math>\text{C}=\text{O}</math> ✓</p> <p><b>Environment 3:</b> (Protons) adjacent/between/surrounded by <math>\text{C}=\text{O}</math> / a ketone <b>AND</b> aldehyde <b>OR</b> <math>\text{C}=\text{O}</math> on both sides ✓</p>	<p>2 (2 ×AO3.1)</p>	<p><b>ALLOW</b> <math>\text{HC}-\text{C}=\text{O}</math></p> <p><b>DO NOT ALLOW</b> <math>\text{H}-\text{C}=\text{O}</math></p> <p><b>DO NOT ALLOW</b> <math>\text{HC}-\text{O}</math> <i>Simply reading <math>\delta = 3.6</math> ppm from data sheet)</i></p> <p><b>IGNORE</b> 'next to 2 Os'</p> <p><b><u>Examiner's Comments</u></b></p> <p>This novel question required candidates to apply their knowledge and understanding of proton NMR spectroscopy to explain different chemical shifts. Most candidates used the <i>Data Sheet</i> in their answers, and most were then able to relate the chemical shift at <math>\delta = 2.5</math> ppm to an adjacent <math>\text{C}=\text{O}</math> group. Fewer candidates were then able to interpret the unexpected chemical shift at <math>\delta = 3.6</math> ppm to the presence of two adjacent <math>\text{C}=\text{O}</math> groups. Less successful responses often resorted to the <i>Data Sheet</i> a second time, suggesting the presence of an adjacent <math>\text{HC}-\text{O}</math> group, despite none being present in the structure.</p> <p>It was encouraging to see how many candidates were able to explain the two chemical shifts correctly, suggesting that most candidates are comfortable with this concept.</p>
