## **WJEC Chemistry AS-level**

2.5: Hydrocarbons

**Practice Questions** 

**England Specification** 

 Crude oil is a complex mixture of hydrocarbons, with samples from different locations in the world having different compositions. The table below gives the composition of crude oil from two locations.

| Fraction        | Percentage by mass |              |
|-----------------|--------------------|--------------|
|                 | Brent Crude        | Gulf of Suez |
| petroleum gases | 2.4                | 1.2          |
| naphtha         | 19.1               | 13.6         |
| kerosene        | 14.2               | 12.7         |
| gas oil         | 20.9               | 18.7         |
| residue         | 43.4               | 53.8         |

|        | kerosene  | 14.2   | 12.7  |
|--------|---|--|---|
|        | gas oil   | 20.9   | 18.7  |
|        | residue   | 43.4   | 53.8  |
|        | e different fractions are separa<br>different boiling temperatures. | ted by fractional distillation. Exp                            | lain why the different fractions [2]                        |
|        |   |  |   |
|        |   |  |   |
|        |   |  |   |
| (b) Th | e petroleum gases produced fr                                       | om crude oil can contain both p                                | ropane and butane   |
| ` '    |   | nas a mass of 145 kg. Assuming olume that this gas would occup | all the petroleum gas released by at 1 atmosphere pressure. |
| [1 mol | of gas occupies 24.0 dm³ unde                                       | er these conditions]   |   |
|        |   |  | [3]   |
|        |   |  |   |
|        |   |  |   |
|        |   |  |   |

| ii) Propane can be chlorinated by a similar method to methane.   |
|--|
| . Give the condition(s) required for the chlorination of propane   |
| [1]  |
| Write an equation for the initiation stage of the chlorination of propane  |
| [1]  |
| II. The chlorination of propane also produces hexane as a minor product.Explain how this compound forms  |
| [2]  |
|  |
| <ul> <li>(c) Naphtha is used as a starting material for the production of alkenes, and these are then used to produce polymers such as poly(ethene). Discuss how poly(ethene) is produced, starting from naphtha. Your answer should include: <ul> <li>An explanation of which of the two types of crude oil given would be more useful for producing alkenes.</li> <li>How the naphtha is converted into alkenes.</li> <li>An equation for the production of ethene from decane, an alkane with 10 carbon atoms.</li> <li>An explanation of what is meant by polymerisation.</li> <li>An equation for the polymerisation of ethene, clearly stating the type of polymerisation that is occurring.</li> <li>A different polymer in common use, with the structure of the monomer used in its production.</li> </ul> </li> <li>[6] QWC [1]</li> </ul> |
|  |
|  |

|         |  | (Total 16        |
|---------|--|------------------|
| 2. (a   | a) Petroleum (crude oil) is separated into useful parts by fractional distillation.  |                  |
| (i) Bri | riefly describe how fractional distillation can be carried out.  |                  |
|         |  | [2               |
| (ii)    | A fraction is treated further to give a <b>branched-chain</b> alkane. The mass of this alkane shows a molecularion, M+, at m/z 72.   | spectrum         |
|         | Use this information to give the molecular formula and then suggest a formula for this alkane.   | displayed<br>[2] |
|         |  |                  |
|         |  |                  |
|         |  |                  |
|         | cracking is a process that is used in the petroleum industry to obtain smaller alkanes and the second control of the control o | ınd              |
| alken   |  | and              |

| (ii) | are   | nane is one of the products when nonane, $C_9H_{20}$ , is cracked. The other probutane and butadiene, $C_4H_6$ . An equation that represents this reaction. | oducts<br>[1] |
|------|-------|---|---------------|
|      |       |   |               |
| (c)  | Meth  | nane reacts with chlorine in a substitution reaction.   |               |
|      | (i)   | The first stage of the reaction is as follows.  |               |
|      |       | Cl <sub>2</sub> → 2Cl•  |               |
|      |       | State an essential condition for this stage.  | [1]           |
|      |       |   |               |
|      | (ii)  | State what is meant by the term propagation stage.  | [1]           |
|      |       |   |               |
|      | (iii) | Write an equation that represents a propagation stage of this reaction.   | [1]           |
|      |       |   |               |

(d) Study the reaction sequence below and then answer the questions that follow.

| (i) Compour      | nd <b>A</b> is a (Z)-isomer.                                  |  |
|------------------|---|--|
| Write the dis    | splayed formula of the ( $\it E$ )-isomer of compound $\it F$ |  |
|                  |   | [1]  |
|                  |   |  |
|                  |   |  |
|                  |   |  |
|                  |   |  |
|                  |   |  |
|                  |   |  |
| (ii) State the   | e name of reagent <b>W</b> and the solvent in which it is     |  |
|                  |   | [1]  |
|                  |   |  |
|                  |   |  |
| (iii) State the  | e name of a catalyst used in the hydrogenation o              | f compound R to produce compound C                 |
| (III) State tile | e hame of a catalyst used in the hydrogenation o              | 1 compound <b>B</b> to produce compound <b>G</b> . |
|                  |   | '  |
|                  |   |  |
| 3.               |   |  |
| 0.               |   |  |
| State which      | ch one of the following formulae represents as                | alkane. [1]  |
| A                | $C_8H_{16}$   |  |
| В                | 0 17  |  |
| C                | C <sub>8</sub> H <sub>18</sub>                                |  |

 $\mathbf{D}$   $\mathbf{C}_{8}\mathbf{H}_{20}$ 

| •••    | The straight-chain alkane containing 19 carbon atoms is called nonadecane.             |         |
|--------|--|---------|
| (a) V  | Write the <b>molecular</b> formula of nonadecane.                                      |         |
|        |  | [1]     |
|        |  |         |
| (b) V  | When nonadecane is cracked, one of the smaller products formed can be octane.          |         |
| Writ   | e an equation to show the cracking of nonadecane to produce octane.                    |         |
|        |  | [1]     |
|        | т)   | otal 2) |
| 5.     | The elements in Group 7 in the Periodic Table can be described as $p$ -block elements. |         |
|        | (a) State why these are described as p-block elements.                                 | [1]     |
|        |  |         |
|        |  |         |
| (b) A  | All halogens are oxidising agents.   |         |
| (i) V  | /hy are the halogens oxidising agents?   |         |
|        |  | [1]     |
|        |  |         |
| /::\ C |  |         |
| (II) S | State, giving a reason, which halogen is the strongest oxidising agent.                |         |
|        |  | [1]     |

| (c)     | ${ m NaClO_3}$ was used as a weedkiller. Give the oxidation state of chlorine in ${ m NaClO_3}$ .  |           |
|---------|--|-----------|
|         | Oxidation state  | [1]       |
|         | ethane reacts with chlorine when exposed to sunlight. The first two stages of the mechanic eaction are <b>initiation</b> and <b>propagation</b> .  | ism of    |
| (i) Giv | ve the equation for the initiation reaction.   |           |
|         |  | [1]       |
| (ii) Gi | ive the equations for <b>two</b> propagation steps involved in the formation of chloromethane.   |           |
|         |  | [2]       |
| (e)     | Chlorofluorocarbons, CFCs, were widely used as refrigerants but they caused environmental damage as a result of reactions involving radical mechanisms.  The first stage of a radical mechanism is an initiation process similar to that in Complete the following equation to show the most likely initiation schlorofluoromethane, CH <sub>2</sub> ClF, and give a reason for your answer. | (d).      |
|         | Reason   |           |
|         |  | Total [9] |

| 6. (a) Propene reacts with hydrogen bromide to give 2-bromopropane.                               |     |
|---|-----|
| (i) Draw the mechanism for this reaction.   |     |
|   | [3] |
|   |     |
|   |     |
|   |     |
|   |     |
|   |     |
|   |     |
|   |     |
|   |     |
|   |     |
|   |     |
|   |     |
