**CHEMISTRY****0620/61**

Paper 6 Alternative to Practical

**May/June 2024****1 hour**

You must answer on the question paper.

No additional materials are needed.

**INSTRUCTIONS**

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- You may use a calculator.
- You should show all your working and use appropriate units.

**INFORMATION**

- The total mark for this paper is 40.
- The number of marks for each question or part question is shown in brackets [ ].
- Notes for use in qualitative analysis are provided in the question paper.

This document has **16** pages. Any blank pages are indicated.

## 2

- 1 A student carries out a titration to find the concentration of a sample of dilute hydrochloric acid.

The student:

- adds  $25.0\text{ cm}^3$  of aqueous potassium hydroxide to the apparatus labelled **A** in Fig. 1.1

Fig. 1.1

- adds a few drops of a suitable indicator to the apparatus labelled **A**
- uses a burette to add dilute hydrochloric acid to the aqueous potassium hydroxide and indicator mixture in the apparatus labelled **A**.

- (a) Name the items of apparatus labelled **A** and **B** in Fig. 1.1.

**A** .....

**B** .....

[2]

- (b) The student adds the indicator after the volume of the  $25.0\text{ cm}^3$  of aqueous potassium hydroxide has been measured.

- (i) Explain why the student adds an indicator to the aqueous potassium hydroxide.

..... [1]

- (ii) Name a suitable indicator.

..... [1]

- (c) Describe how the student can determine the volume of dilute hydrochloric acid used in this titration.

.....

..... [2]

3

- (d) The student observes the colour changes that occur as they add dilute hydrochloric acid from the burette.

State one **other** thing the student should do as they add the dilute hydrochloric acid to the aqueous potassium hydroxide.

.....

..... [1]

[Total: 7]

**BLANK PAGE**

- 2 A student investigates the temperature change when magnesium reacts with dilute sulfuric acid.

The student does five experiments.

#### Experiment 1

- Use a  $25\text{ cm}^3$  measuring cylinder to pour  $20\text{ cm}^3$  of dilute sulfuric acid into a boiling tube.
- Use a thermometer to measure the initial temperature of the acid in the boiling tube. Record the initial temperature.
- Add a coiled 5 cm length of magnesium ribbon to the acid in the boiling tube. At the same time start a timer.
- Continually stir the contents of the boiling tube using the thermometer.
- After 45 seconds, measure the temperature of the mixture in the boiling tube. Record this temperature.
- Rinse the boiling tube with distilled water.

#### Experiment 2

- Use the  $25\text{ cm}^3$  measuring cylinder to pour  $20\text{ cm}^3$  of dilute sulfuric acid into the boiling tube.
- Use a  $10\text{ cm}^3$  measuring cylinder to add  $2.0\text{ cm}^3$  of distilled water to the acid in the boiling tube.
- Place a bung in the boiling tube and invert the tube to mix the acid and water.
- Use the thermometer to measure the initial temperature of the contents of the boiling tube. Record the initial temperature.
- Add a coiled 5 cm length of magnesium ribbon to the contents of the boiling tube. At the same time start a timer.
- Continually stir the contents of the boiling tube using the thermometer.
- After 45 seconds, measure the temperature of the mixture. Record this temperature.
- Rinse the boiling tube with distilled water.

#### Experiment 3

- Repeat Experiment 2, adding  $4.0\text{ cm}^3$  of distilled water instead of  $2.0\text{ cm}^3$ .

#### Experiment 4

- Repeat Experiment 2, adding  $6.0\text{ cm}^3$  of distilled water instead of  $2.0\text{ cm}^3$ .

#### Experiment 5

- Repeat Experiment 2, adding  $10.0\text{ cm}^3$  of distilled water instead of  $2.0\text{ cm}^3$ .

- (a) Use the information in the description of the experiments and the thermometer diagrams to complete Table 2.1.

Table 2.1

| experiment | volume of dilute sulfuric acid /cm <sup>3</sup> | volume of distilled water /cm <sup>3</sup> | initial temperature /°C | thermometer diagram after 45 s /°C                                                   | temperature after 45 s /°C | temperature increase /°C |
|------------|-------------------------------------------------|--------------------------------------------|-------------------------|--------------------------------------------------------------------------------------|----------------------------|--------------------------|
| 1          |                                                 |                                            | 25.0                    |    |                            |                          |
| 2          |                                                 |                                            | 25.5                    |    |                            |                          |
| 3          |                                                 |                                            | 25.5                    |   |                            |                          |
| 4          |                                                 |                                            | 26.0                    |  |                            |                          |
| 5          |                                                 |                                            | 26.0                    |  |                            |                          |

[5]

- (b) (i) State which Experiment, 1, 2, 3, 4 or 5, had the smallest temperature change.

..... [1]

- (ii) Explain why the temperature change was smallest in the experiment you have given in (b)(i).

.....

..... [1]

- (c) Complete a suitable scale on the y-axis and plot your results from Experiments 1 to 5 on Fig. 2.1. Draw a line of best fit.

**Fig. 2.1**

[4]

- (d) Use your graph in Fig. 2.1 to deduce the temperature increase when Experiment 2 is repeated with  $7.5 \text{ cm}^3$  of distilled water instead of  $2.0 \text{ cm}^3$ .

Show clearly **on Fig. 2.1** how you worked out your answer.

..... °C  
[2]

- (e) The average rate of temperature increase in each experiment is calculated using the equation shown.

$$\text{average rate of temperature increase} = \frac{\text{temperature increase}}{45 \text{ seconds}}$$

Calculate the average rate of temperature increase in Experiment 1. Give units for the rate you have calculated.

average rate of temperature increase = .....

units = ..... [2]

- (f) (i) Explain why the results of the experiment are more accurate if the boiling tube is wrapped in cotton wool.

.....  
 .....  
 ..... [2]

- (ii) Explain why a 25.0 cm<sup>3</sup> volumetric pipette **cannot** be used to accurately measure the volume of the distilled water added.

.....  
 ..... [1]

- (iii) State one **other** way in which the **apparatus** can be changed to give more accurate results.

.....  
 .....  
 ..... [1]

- (g) Sketch **on Fig. 2.1** the graph you would expect if all of the experiments were repeated using a 2 cm length of magnesium ribbon instead of the 5 cm length.

Label your line **g**. [1]

[Total: 20]

- 3** A student tests two substances: solution **E** and solid **F**.

**Tests on solution E**

Solution **E** is aqueous chromium(III) bromide.

Solution **E** is divided into two portions.

Record the expected observations.

- (a)** To the first portion of solution **E**, the student adds aqueous sodium hydroxide dropwise and then in excess.

observations adding dropwise .....

.....

observation in excess .....

.....

[2]

- (b)** To the second portion of solution **E**, the student adds about 1 cm<sup>3</sup> of dilute nitric acid and a few drops of aqueous silver nitrate.

observations .....

..... [1]

### Tests on solid F

Table 3.1 shows the tests and the student's observations for solid F.

**Table 3.1**

| tests                                                                                                                                                                                                                                                                                                                                           | observations                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>test 1</b><br><br>Heat about half of solid F in a boiling tube until there is no further change.                                                                                                                                                                                                                                             | the white solid forms a colourless liquid, steam comes out from the boiling tube and condensation is seen at the top of the boiling tube, after a while the colourless liquid becomes a white solid |
| <b>test 2</b><br><br>The remaining solid F is dissolved in water to form solution F. Solution F is divided into three portions.<br><br>To the first portion of solution F in a boiling tube, add aqueous sodium hydroxide dropwise and then in excess.<br><br>Warm the product and hold damp red litmus paper at the mouth of the boiling tube. | no change<br><br><br>the damp red litmus paper remains red                                                                                                                                          |
| <b>test 3</b><br><br>To the second portion of solution F, add 1 cm <sup>3</sup> of dilute nitric acid followed by a few drops of aqueous barium nitrate.                                                                                                                                                                                        | white precipitate                                                                                                                                                                                   |
| <b>test 4</b><br><br>To the third portion of solution F, add a few drops of acidified aqueous potassium manganate(VII).                                                                                                                                                                                                                         | the solution becomes light purple                                                                                                                                                                   |

(c) The observations in **test 1** show that solid F is hydrated.

Describe a chemical test to show that the condensation at the top of the boiling tube contains water.

test .....

result .....

[2]

## 11

(d) From the tests and observations in Table 3.1 it is **not** possible to identify the cation in solid **F**.

Give another test that can be carried out to help identify the cation in solid **F**.

.....

..... [1]

(e) Identify the anion in solid **F**.

[Total: 7]

## Notes for use in qualitative analysis

### Tests for anions

| anion                                        | test                                                              | test result                                                                             |
|----------------------------------------------|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| carbonate, $\text{CO}_3^{2-}$                | add dilute acid, then test for carbon dioxide gas                 | effervescence, carbon dioxide produced                                                  |
| chloride, $\text{Cl}^-$<br>[in solution]     | acidify with dilute nitric acid, then add aqueous silver nitrate  | white ppt.                                                                              |
| bromide, $\text{Br}^-$<br>[in solution]      | acidify with dilute nitric acid, then add aqueous silver nitrate  | cream ppt.                                                                              |
| iodide, $\text{I}^-$<br>[in solution]        | acidify with dilute nitric acid, then add aqueous silver nitrate  | yellow ppt.                                                                             |
| nitrate, $\text{NO}_3^-$<br>[in solution]    | add aqueous sodium hydroxide, then aluminium foil; warm carefully | ammonia produced                                                                        |
| sulfate, $\text{SO}_4^{2-}$<br>[in solution] | acidify with dilute nitric acid, then add aqueous barium nitrate  | white ppt.                                                                              |
| sulfite, $\text{SO}_3^{2-}$                  | add a small volume of acidified aqueous potassium manganate(VII)  | the acidified aqueous potassium manganate(VII) changes colour from purple to colourless |

### Tests for aqueous cations

| cation                          | effect of aqueous sodium hydroxide                                         | effect of aqueous ammonia                                                  |
|---------------------------------|----------------------------------------------------------------------------|----------------------------------------------------------------------------|
| aluminium, $\text{Al}^{3+}$     | white ppt., soluble in excess, giving a colourless solution                | white ppt., insoluble in excess                                            |
| ammonium, $\text{NH}_4^+$       | ammonia produced on warming                                                | —                                                                          |
| calcium, $\text{Ca}^{2+}$       | white ppt., insoluble in excess                                            | no ppt. or very slight white ppt.                                          |
| chromium(III), $\text{Cr}^{3+}$ | green ppt., soluble in excess                                              | green ppt., insoluble in excess                                            |
| copper(II), $\text{Cu}^{2+}$    | light blue ppt., insoluble in excess                                       | light blue ppt., soluble in excess, giving a dark blue solution            |
| iron(II), $\text{Fe}^{2+}$      | green ppt., insoluble in excess, ppt. turns brown near surface on standing | green ppt., insoluble in excess, ppt. turns brown near surface on standing |
| iron(III), $\text{Fe}^{3+}$     | red-brown ppt., insoluble in excess                                        | red-brown ppt., insoluble in excess                                        |
| zinc, $\text{Zn}^{2+}$          | white ppt., soluble in excess, giving a colourless solution                | white ppt., soluble in excess, giving a colourless solution                |

**Tests for gases**

| gas                           | test and test result                                                       |
|-------------------------------|----------------------------------------------------------------------------|
| ammonia, $\text{NH}_3$        | turns damp red litmus paper blue                                           |
| carbon dioxide, $\text{CO}_2$ | turns limewater milky                                                      |
| chlorine, $\text{Cl}_2$       | bleaches damp litmus paper                                                 |
| hydrogen, $\text{H}_2$        | 'pops' with a lighted splint                                               |
| oxygen, $\text{O}_2$          | relights a glowing splint                                                  |
| sulfur dioxide, $\text{SO}_2$ | turns acidified aqueous potassium manganate(VII) from purple to colourless |

**Flame tests for metal ions**

| metal ion                    | flame colour |
|------------------------------|--------------|
| lithium, $\text{Li}^+$       | red          |
| sodium, $\text{Na}^+$        | yellow       |
| potassium, $\text{K}^+$      | lilac        |
| calcium, $\text{Ca}^{2+}$    | orange-red   |
| barium, $\text{Ba}^{2+}$     | light green  |
| copper(II), $\text{Cu}^{2+}$ | blue-green   |
