(3)

## Questions are for both separate science and combined science students unless indicated in the question

his	question is about acids and their reactions.
Acid	s can be either weak or strong.
(a)	What is meant by 'a weak acid'? (HT only)
(b)	Explain what happens to the pH of an acid as the acid is diluted with water.
` ,	
(c)	A student does a titration to find the volume of acid needed to neutralise an alkali.
	The student fills a burette with the acid.
	Give <b>three</b> more steps the student must do before adding the acid to the alkali from the burette. <b>(chemistry only)</b>
	You should name any equipment used.
	1
	2
	3

(d)	The student titrated a solution containing 0.0045 moles of sodium hydroxide with 0.15 mol/dm³ hydrochloric acid.	
	The equation for the reaction is:	
	NaOH + HCl → NaCl + H <sub>2</sub> O	
	Calculate the volume of hydrochloric acid in cm³ needed in the titration. (chemistry only) (HT only)	
	Volume of acid = cm <sup>3</sup>	(2)
(e)	A calcium atom is larger than a magnesium atom.	
	Explain why calcium reacts more vigorously than magnesium with hydrochloric acid of the same concentration.	
		(3)
	(Total 12 m	arks)

(2)

Q2.	s question is about acids and alkalis.	
(a)	Ethanoic acid is a weak acid.	
	What is meant by 'weak acid'? (HT only)	
	Answer in terms of ionisation.	
		(1)
(b)	The concentration of an acid can be measured in mol/dm <sup>3</sup> .	
	Which combination of changes <b>increases</b> the concentration of an acid? <b>(chemistry only)</b> (HT only)	
	Tick (✓) <b>one</b> box.	
	The mass of acid dissolved is halved and the volume of the solution is halved.	
	The mass of acid dissolved is halved and the volume of the solution is doubled.	
	The mass of acid dissolved is doubled and the volume of the solution is halved.	
	The mass of acid dissolved is doubled and the volume of the solution is doubled.	
		(1)
(c)	The concentration of an acid can be determined by titration.	
	An indicator is added to an alkali in a flask.	
	Name an indicator that can be used in this titration.	
	Give the colour change of the indicator when acid from a burette is added to the alkali in the flask. (chemistry only)	

Name of indicator

Colour change from \_\_\_\_\_\_ to \_\_\_\_\_

A student does a titra	ation using sodium carbonate solution and nitric ac	id.
The equation for the i	reaction is:	
Na <sub>2</sub>	$_{2}\text{CO}_{3}$ + 2 HNO <sub>3</sub> $\rightarrow$ 2 NaNO <sub>3</sub> + CO <sub>2</sub> + H <sub>2</sub> O	
25.0 cm³ of 0.124 mo 23.6 cm³ of nitric acid	ol/dm³ sodium carbonate solution is neutralised by d.	
Calculate the concen	ntration of the nitric acid. (chemistry only) (HT onl	y)
Give your answer to 3	3 significant figures.	
<ul> <li>the number of r</li> </ul>	e: moles of sodium carbonate in 25.0 cm <sup>3</sup> of the solut moles of nitric acid in 23.6 cm <sup>3</sup> of the nitric acid on of the nitric acid in mol/dm <sup>3</sup> .	iion

When hydrochloric acid dissolves in water, hydrogen ions ( $H^+$ ) and chloride ions ( $Cl^-$ ) are produced.

f)	A solution of hydrochloric acid with pH 4.5 has a concentration of H $^{\dagger}$ ions of 3.16 × 10 $^{-5}$ mol/dm $^{3}$ .
	What is the concentration of H <sup>+</sup> ions in a solution of hydrochloric acid with pH 2.5? (HT only)
	Concentration of H <sup>+</sup> ions = mol/dm <sup>3</sup>
g)	Which element has atoms that have the same electronic structure as the chloride ion?
	Use the periodic table.
	(Total 12 mark

	2	
u	Į.	

П	nis ques	tion is	abou <sup>*</sup>	t acids	and	alkal	is.
---	----------	---------	-------------------	---------	-----	-------	-----

- (a) Explain why the pH of an acid depends on: (HT only)
  - the strength of the acid

•	the concentration of the acid.

(b) A student titrated 25.00 cm³ of hydrochloric acid with 0.100 mol/dm³ barium hydroxide solution.

The table below shows the results.

Titration number	1	2	3	4	5
Volume of barium hydroxide solution used in cm <sup>3</sup>	23.90	23.45	23.55	23.55	23.45

The student calculated the volume of barium hydroxide solution to be used in the titration calculation as  $23.50\ cm^3$ .

Explain why the student used a volume of 23.50 cm <sup>3</sup> of barium hydroxide solution the titration calculation. (chemistry only)		

(4)

25.00 cm³ of the hydrochloric acid reacted with 23.50 cm³ of the 0.100 mol/dm³ barium hydroxide solution.
The equation for the reaction is:
2 $HCI(aq) + Ba(OH)_2(aq) \rightarrow BaCI_2(aq) + 2 H_2O(I)$
Calculate the concentration of the hydrochloric acid in mol/dm³. (chemistry only) (HT only)
Concentration of the hydrochloric acid =mol/dm³

Another student titrated sulfuric acid with barium hydroxide solution.

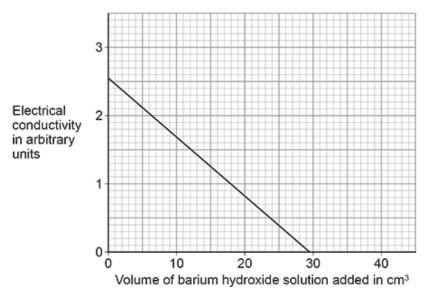

The equation for the reaction is:

$$H_2SO_4(aq) + Ba(OH)_2(aq) \rightarrow BaSO_4(s) + 2 H_2O(l)$$

The student measured the electrical conductivity of the mixture during the titration.

The better a conductor, the higher the electrical conductivity value.

The figure below shows the results.

(d) Explain why the electrical conductivity of the mixture was zero when the sulfuric acid had just been neutralised.

Use the equation for the reaction.

Refer to ions in your answer.

•			

	(1) (Total 14 marks)					
	Give <b>one</b> reason why.					
	The electrical conductivity of the mixture increased.					
(e)	The student then added a further 10 cm³ of barium hydroxide solution.
