1 The table gives the melting points, the boiling points and the electrical properties of six substances A to F.

| substance | melting point<br>/°C | boiling point<br>/°C | electrical conductivity<br>as a solid | electrical conductivity<br>as a liquid |
|-----------|----------------------|----------------------|---------------------------------------|--|
| A         | -210                 | -196                 | does not conduct                      | does not conduct                       |
| В         | 777                  | 1627                 | does not conduct                      | good conductor                         |
| С         | 962                  | 2212                 | good conductor                        | good conductor                         |
| D         | -94                  | 63                   | does not conduct                      | does not conduct                       |
| E         | 1410                 | 2355                 | does not conduct                      | does not conduct                       |
| F         | 1064                 | 2807                 | good conductor                        | good conductor                         |

| (a) | Which two substances could be metals?                                      | [1]  |
|-----|--|------|
| (b) | Which substance could be nitrogen?   | [1]  |
| (c) | Which substance is an ionic solid?   | [1]  |
| (d) | Which substance is a liquid at room temperature?                           | [1]  |
| (e) | Which substance has a giant covalent structure similar to that of diamond? | [1]  |
| (f) | Which <b>two</b> substances could exist as simple covalent molecules?      | [1]  |
|     | [Total   | : 6] |

| The Gro         | oup I metals show trends in both their physical and chemical properties.  |      |
|-----------------|---|------|
| (a)             | How do their melting points vary down the Group?  |      |
|                 |   | [1]  |
| (ii)            | Which element in the Group has the highest density?   |      |
|                 |   | [1]  |
| (iii)           | All Group I metals react with cold water. Complete the following equation.  |      |
|                 | Rb +H <sub>2</sub> O $\rightarrow$ +  | [2]  |
| <b>(b)</b> Lith | nium reacts with nitrogen to form the ionic compound, lithium nitride.  |      |
| (i)             | State the formula of the lithium ion  | [1]  |
| (ii)            | Deduce the formula of the nitride ion   | [1]  |
| (iii)           | In all solid ionic compounds, the ions are held together in a lattice.<br>Explain the term <i>lattice</i> .         |      |
|                 |   |      |
|                 |   | [1]  |
| (iv)            | What is the ratio of lithium ions to nitride ions in the lattice of lithium nitride? Give a reason for your answer. |      |
|                 | lithium ions : nitride ions   |      |
|                 |   | [2]  |
|                 | [Total  | : 9] |

2

- 3 The uses of a substance are determined by its properties.
  - (a) Plastics are poor conductors of electricity. They are used as insulation for electric cables. Which other **two** properties of plastics make them suitable for this purpose?

.....

(b) Chromium is a hard, shiny metal. Suggest two reasons why chromium is used to electroplate steel.

.....

- ......[2]
- (c) Why is aluminium used extensively in the manufacture of aeroplanes?

 (d) Why is copper a suitable material from which to make cooking utensils?

4 Three of the halogens in Group VII are listed below

## chlorine

## bromine iodine

| (a)                                     |                     | How does their colour change down the Group?  |
|---|---------------------|---|
|   |                     |   |
|   | (ii)                | How do their melting points and boiling points change down the Group?   |
|   |                     |   |
|   | (iii)               | Predict the colour and physical state (solid, liquid or gas) of astatine, At.   |
|   |                     | colour  |
|   |                     | physical state[2  |
| (b)                                     | A ra                | adioactive isotope of iodine, <sup>131</sup> 1, is used to treat cancer.  |
|   | (i)                 | Define the term <i>isotope</i> .  |
|   |                     |   |
|   |                     |   |
|   | (ii)                | How many protons, electrons and neutrons are there in one atom of $^{131}_{53}$ I?  |
|   |                     | number of protons   |
|   |                     | number of electrons   |
|   |                     | number of neutrons  |
|   | (iii)               | When this isotope, ${}^{131}_{53}I$ , emits radiation, a different element with a proton number o 54 is formed.<br>What is the name of this element?                  |
|   |                     | [1  |
| (c)                                     | Flue<br>two<br>Dec  | orine, the most reactive halogen, forms compounds with the other halogens. It forms<br>compounds with bromine.<br>duce their formulae from the following information. |
|   | con                 | npound 1  |
|   | I he                | e mass of one mole of this compound is 137 g.   |

[Total: 11]

- 5 The first three elements in Group IV are carbon, silicon, germanium.
  - (a) The element germanium has a diamond-type structure. Describe the structure of germanium. A diagram is acceptable.

[2]

- (b) Unlike diamond, graphite is soft and is a good conductor of electricity.
  - (i) Explain why graphite has these properties.

|     |                   | [3]   |
|-----|-------------------|---|
|     | (ii)              | Give a use of graphite that depends on one of these properties.   |
|     |                   | property  |
|     |                   | use [1]   |
| (c) | Car<br>stru       | bon dioxide and silicon(IV) oxide have similar formulae but different types of acture.  |
|     | (i)               | Give the formulae of these oxides.  |
|     |                   | [1]   |
|     | (ii)              | How are their structures different?   |
|     |                   |   |
|     |                   |   |
| (d) | All<br>hyd<br>whi | these elements form compounds with hydrogen called hydrides. The saturated lrides of carbon are the alkanes. Predict the formula of the hydride of germanium ch contains two germanium atoms. |

## PhysicsAndWathsTutor.com [1]

| 6 | (a  | Cop<br>of r | oper has the structure of a typical metal. It has a lattice of positive ions and a "sea nobile electrons. The lattice can accommodate ions of a different metal. | "  |  |  |  |
|---|-----|-------------|--|----|--|--|--|
|   |     | Giv         | Sive a <b>different</b> use of copper that depends on each of the following.   |    |  |  |  |
|   |     | (i)         | the ability of the ions in the lattice to move past each other   |    |  |  |  |
|   |     |             | [1   | 1] |  |  |  |
|   |     | (ii)        | the presence of mobile electrons   |    |  |  |  |
|   |     |             | [1   | 1] |  |  |  |
|   |     | (iii)       | the ability to accommodate ions of a different metal in the lattice  |    |  |  |  |
|   |     |             | [1   | 1] |  |  |  |
|   | (b) | Aqu<br>ion: | ueous copper(II) sulphate solution can be electrolysed using carbon electrodes. The s present in the solution are as follows.                                    | Э  |  |  |  |
|   |     |             | Cu <sup>2+</sup> (aq), 4 <sup>2</sup> (aq), <sup>+</sup> (aq), (aq)  |    |  |  |  |
|   |     | (i)         | Write an ionic equation for the reaction at the negative electrode (cathode).  |    |  |  |  |
|   |     |             | [1   | [] |  |  |  |
|   |     | (ii)        | A colourless gas was given off at the positive electrode (anode) and the solution changes from blue to colourless.   | n  |  |  |  |
|   |     |             | Explain these observations.  |    |  |  |  |
|   |     |             |  |    |  |  |  |
|   |     |             | [2   | 2] |  |  |  |

- (c) Aqueous copper(II) sulphate can be electrolysed using copper electrodes. The reaction at the negative electrode is the same but the positive electrode becomes smaller and the solution remains blue.
  - (i) Write a word equation for the reaction at the positive electrode.

| (ii)  | Explain why the colour of the solution does not change. | [1] |
|-------|---|-----|
|       |   |     |
| (iii) | What is the large scale use of this electrolysis?       | [-] |
|       |   | [1] |
