

AQA Computer Science A-Level
4.5.3 Units of information
Intermediate Notes

Specification:

4.5.3.1 Bits and bytes:

Know that:

- the bit is the fundamental unit of information
- a byte is a group of 8 bits

Know that the 2^n different values can be represented with n bits.

4.5.3.2 Units:

Know that quantities of bytes can be described using binary prefixes representing powers of 2 or using decimal prefixes representing powers of 10, eg one kibibyte is written as $1\text{KiB} = 2^{10}$ B and one kilobyte is written as $1\text{kB} = 10^3$ B.

Know the names, symbols and corresponding powers of 2 for the binary prefixes:

- kibi, Ki - 2^{10}
- mebi, Mi - 2^{20}
- gibi, Gi - 2^{30}
- tebi, Ti - 2^{40}

Know the names, symbols and corresponding powers of 10 for the decimal prefixes:

- kilo, k - 10^3
- mega, M - 10^6
- giga, G - 10^9
- tera, T - 10^{12}

Bits and bytes

A **bit** can only take **two values**, 1 and 0. A group of **8 bits** is called a **byte**. Half a byte (4 bits) is called a **nybble**.

A bit is notated with a **lowercase** b whereas a byte uses a **capital** B.

$$2b = 2 \text{ bits}$$

$$3B = 3 \text{ bytes} = 3 * 8 \text{ bits} = 24 \text{ bits}$$

The number of **different values** that can be represented with a **specified number of bits** varies with the number of bits. The more bits that are assigned to a number, the greater the number of values that can be represented.

More specifically, there are 2^n different values that can be represented with n bits.

For example, using just 2 bits, there are four (2^2) possible **permutations** of the bits and hence four **different values** that can be represented, as shown below.

00

01

10

11

If we use a byte (8 bits), there are 256 (2^8) different values that can be represented.

Units

Quantities of bytes can be described using **binary prefixes** or **decimal prefixes**. Binary prefixes go up in **powers of two** whereas decimal prefixes go up in **powers of ten**.

You will be familiar with decimal prefixes from everyday life. For example, 1000 grams is 1 kilogram. Binary prefixes are not used as frequently as decimal prefixes but they have **similar sizes**.

| Binary | | Decimal | |
|-----------|---|----------|-----------------------------------|
| Prefix | Value | Prefix | Value |
| Kibi (Ki) | 2^{10} = 1024 | Kilo (K) | 10^3 = 1000 |
| Mebi (Mi) | 2^{20} = 1048576 | Mega (M) | 10^6 = 1000000 |
| Gibi (Gi) | 2^{30} = 1073741824 | Giga (G) | 10^9 = 1000000000 |
| Tebi (Ti) | 2^{40} $\approx 1.0995 \times 10^{12}$ | Tera (T) | 10^{12} = 1×10^{12} |
