CANDIDATE NAME					
CENTRE NUMBER			CANDIDATE NUMBER		

COMPUTER SCIENCE 9608/41

Paper 4 Further Problem-solving and Programming Skills

October/November 2019

2 hours

Candidates answer on the Question Paper.

No Additional Materials are required.

No calculators allowed.

READ THESE INSTRUCTIONS FIRST

Write your centre number, candidate number and name in the spaces at the top of this page. Write in dark blue or black pen.

You may use an HB pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer **all** questions.

No marks will be awarded for using brand names of software packages or hardware.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

The maximum number of marks is 75.

1 Each student at CIE University needs a printing account to print documents from university computers.

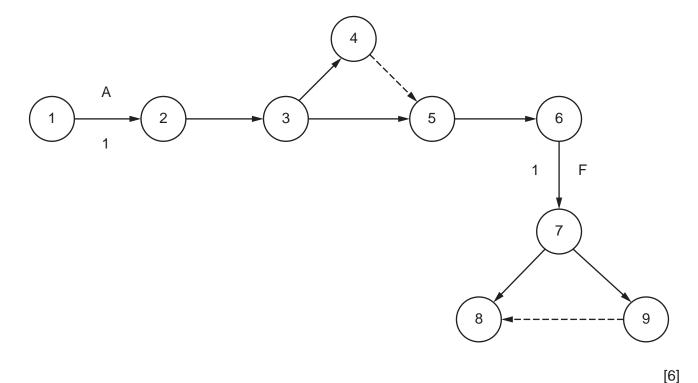

The university is developing software to manage each student's printing account and the printing process.

(a) Developing the software will include the following activities.

Activity	Description	Time in weeks	Predecessor
А	Identify requirements	1	-
В	Produce design	3	A
С	Write code	10	В
D	Test modules	7	В
Е	Final system black-box testing	3	C, D
F	Install software	1	E
G	Acceptance testing	2	F
Н	Create user documentation	2	F

(i) Add the correct activities and times to the following Program Evaluation Review Technique (PERT) chart for the software development.

Two activities and times have been done for you.

(ii)	State what is meant by the critical path in a PERT chart.
	[1]
(iii)	Identify and describe a project planning technique, other than a PERT chart.
	[2]
(b) W	hen a student prints a document, a print job is created. The print job is sent to a print server.
	ne print server uses a queue to hold each print job waiting to be printed.
(i)	The queue is circular and has six spaces to hold jobs.
	The queue currently holds four jobs waiting to be printed. The jobs have arrived in the order A, B, D, C.
	Complete the diagram to show the current contents of the queue.
	Start Pointer End Pointer
	[1]
(ii)	Print jobs A and B are now complete. Four more print jobs have arrived in the order E, F, G, H.
	Complete the diagram to show the current contents and pointers for the queue.
	[3]
(iii)	State what would happen if another print job is added to the queue in the status in part (b)(ii) .
	[1]

4

(iv) The queue is stored as an array, Queue, with six elements. The following algorithm removes a print job from the queue and returns it.

Complete the following **pseudocode** for the function Remove.

FUNCTION Remove RETURNS STRING
DECLARE PrintJob : STRING
IF = EndPointer
THEN
RETURN "Empty"
ELSE
PrintJob ← Queue[]
<pre>IF StartPointer =</pre>
THEN
StartPointer ←
ELSE
$StartPointer \leftarrow StartPointer + 1$
ENDIF
RETURN PrintJob
ENDIF
ENDFUNCTION [4
Explain why the circular queue could not be implemented as a stack.
[2]

© UCLES 2019 9608/41/O/N/19

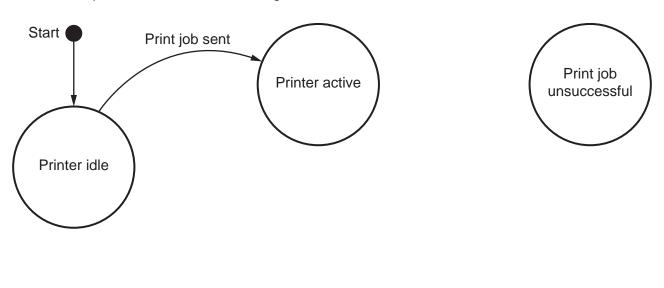

(v)

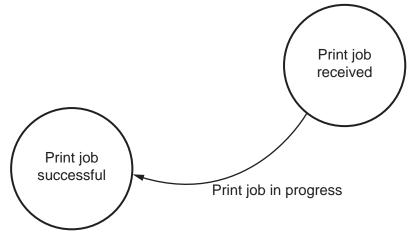

(c) The university wants to analyse how a printer and a print server deal with the print jobs.

The following table shows the transitions from one state to another for the process.

Current state	Event	Next state
Printer idle	Print job sent	Printer active
Printer active	Print job added to queue	Print job received
Print job received	Print job in progress	Print job successful
Print job received	Print job in progress	Print job unsuccessful
Print job successful	Check print queue	Printer active
Print job unsuccessful	Error message displayed	Printer active
Printer active	Timeout	Printer idle

Complete the state-transition diagram for the table.

[5]

(d) The university wants to assess troubleshooting issues with a printer. It wants to use a decision table to do this.

The troubleshooting actions are:

- check the connection from computer to printer, if the error light is flashing **and** the document has not been printed
- check the ink status, if the quality is poor
- check whether there is a paper jam, if the error light is flashing and the document has not been printed
- check the paper size selected, if the paper size is incorrect.

(i)	Describe the purpose of a decision table.
	[2]

(ii) Complete the rules for the actions in the following decision table.

					Ru	les			
	Document printed but the quality is poor	Υ	Υ	Υ	Υ	N	N	N	N
Conditions	Error light is flashing on printer	Υ	Υ	N	N	Y	Υ	N	N
	Document printed but paper size is incorrect	Υ	N	Υ	N	Υ	N	Υ	N
	Check connection from computer to printer								
Actions	Check ink status								
Actions	Check if there is a paper jam								
	Check the paper size selected								

[4]

(iii) Simplify your solution by removing redundancies.

			Ru	les		
	Document printed but the quality is poor					
Conditions	Error light is flashing on printer					
	Document printed but paper size is incorrect					
	Check connection from computer to printer					
Actions	Check ink status					
Actions	Check if there is a paper jam					
	Check the paper size selected					

[5]

(e) There are 1000 students at the university. They will each require a printing account.

Students need to buy printing credits that will be added to their account. Each page printed uses one printing credit.

The university needs software to keep track of the number of printing credits each student has in their account. The university has decided to implement the software using object-oriented programming (OOP).

The following diagram shows the design for the class PrintAccount. This includes the attributes and methods.

```
PrintAccount
FirstName :
              STRING
                            parameter sent to Constructor()
                        //
LastName
              STRING
                         //
                            parameter sent to Constructor()
PrintID
              STRING
                            parameter sent to Constructor()
Credits
                            initialised to 50
           :
              INTEGER
                         //
Constructor()
                     instantiates an object of the PrintAccount class,
                 //
                     and assigns initial values to the attributes
GetName()
                     returns FirstName and LastName concatenated
                     with a space between them
                 //
GetPrintID()
                     returns PrintID
                     sets the FirstName for a student
SetFirstName()
                     sets the LastName for a student
SetLastName()
                 //
                     sets the PrintID for a student
SetPrintID()
                 //
AddCredits()
                 //
                     increases the number of credits for a student
                     removes credits from a student account
RemoveCredits()
```

(i)	Write program code for the Constructor() method.
	Programming language
	Program code
	[4]
(ii)	Write program code for the SetFirstName() method.
	Programming language
	Program code
	[2]
(iii)	Write program code for the GetName() method.
	Programming language
	Program code
	[2]
	··········· [=]

- (iv) The method AddCredits() calculates the number of printing credits a student buys and adds the printing credits to the student's account.
 - Credits cost \$1 for 25 credits.
 - If a student buys \$20 or more of credits in a single payment, they receive an extra 50 credits.
 - If a student buys between \$10 and \$19 (inclusive) of credits in a single payment, they receive an extra 25 credits.

Payment from a student is stored in the variable MoneyInput. This is passed as a parameter.

Write $program\ code\ for\ AddCredits().$ Use constants for the values that do not change.

Programming language
Program code
[6]

(v)	A global array, StudentAccounts, stores 1000 instances of PrintAccount.	
	Write pseudocode to declare the array StudentAccounts.	
		[2

- (vi) The main program has a procedure, CreateID(), that:
 - takes the first name and last name as parameters
 - creates PrintID that is a concatenation of:
 - the first three letters of the first name in lower case
 - the first three letters of the last name in lower case
 - the character '1'
 - for example, the name Bill Smith would produce "bilsmi1"
 - checks if the PrintID created already exists in the global array StudentAccounts:
 - If PrintID does not exist, it creates an instance of PrintAccount in the next free index in StudentAccounts.
 - If PrintID does exist, the number is incremented until a unique ID is created, for example, "bilsmi2". It then creates an instance of PrintAccount in the next free index in StudentAccounts.

The global variable NumberStudents stores the number of print accounts that have currently been created.

Write program code for the procedure CreateID(). Do not write the procedure header.

2 The following table shows part of the instruction set for a processor, which has one general purpose register, the Accumulator (ACC), and an Index Register (IX).

Ins	truction	Evalenation						
Op code Operand		Explanation						
LDM	#n	Immediate addressing. Load the number n to ACC.						
LDD	<address></address>	Direct addressing. Load the contents of the location at the given address to ACC.						
LDI	<address></address>	Indirect addressing. The address to be used is at the given address. Load the contents of this second address to ACC.						
LDX	<address></address>	Indexed addressing. Form the address from <address> + the contents of the Index Register. Copy the contents of this calculated address to ACC.</address>						
LDR	#n	Immediate addressing. Load the number n to IX.						
STO	<address></address>	Store the contents of ACC at the given address.						
STX	<address></address>	Indexed addressing. Form the address from <address> + the contents of the Index Register. Copy the contents from ACC to this calculated address.</address>						
ADD	<address></address>	Add the contents of the given address to the ACC.						
INC	<register></register>	Add 1 to the contents of the register (ACC or IX).						
DEC	<register></register>	Subtract 1 from the contents of the register (ACC or IX).						
JMP	<address></address>	Jump to the given address.						
CMP	<address></address>	Compare the contents of ACC with the contents of <address>.</address>						
CMP	#n	Compare the contents of ACC with number n.						
JPE	<address></address>	Following a compare instruction, jump to <address> if the compare was True.</address>						
JPN	<address></address>	Following a compare instruction, jump to <address> if the compare was False.</address>						
AND	#n	Bitwise AND operation of the contents of ACC with the operand.						
AND	<address></address>	Bitwise AND operation of the contents of ACC with the contents of <address>.</address>						
XOR	#n	Bitwise XOR operation of the contents of ACC with the operand.						
XOR	<address></address>	Bitwise XOR operation of the contents of ACC with the contents of <address>.</address>						
OR	#n	Bitwise OR operation of the contents of ACC with the operand.						
OR	<address></address>	Bitwise OR operation of the contents of ACC with the contents of <address>. <address> can be an absolute address or a symbolic address.</address></address>						
LSL	#n	Bits in ACC are shifted n places to the left. Zeros are introduced on the right hand end.						
LSR	#n	Bits in ACC are shifted n places to the right. Zeros are introduced on the left hand end.						
IN		Key in a character and store its ASCII value in ACC.						
OUT		Output to the screen the character whose ASCII value is stored in ACC.						
END		Return control to the operating system.						

A programmer writes a program that multiplies two numbers together and outputs the result. The numbers are stored as NUMONE and NUMTWO.

The programmer has started to write the program in the following table. The comment column contains explanations for some of the missing program instructions and data.

Complete the program using the given instruction set.

Label	Op code	Operand	Comment
LOOP:			// load the value from ANSWER
			// add the value from NUMONE
			// load the value from COUNT
			// increment the Accumulator
			// is NUMTWO = COUNT ?
			// if false, jump to LOOP
			// load the value from ANSWER
			// output ANSWER to the screen
			// end of program
NUMONE:	2		
NUMTWO:	4		
COUNT:	0		
ANSWER:	0		

3	Software may not perform as expected. One reason for this is that a syntax error exists in the code.
	Identify three other reasons why software may not perform as expected.
	1
	2
	3
	[3]
4	The following table contains definitions related to testing terminology

4 The following table contains definitions related to testing terminology.

Complete the table with the correct testing term to match the definition.

Definition	Term
Software is tested by an in-house team of dedicated testers.	
Software is tested by the customer before it is signed off.	
Software is tested by a small selection of users before general release.
