GCSE COMPUTER SCIENCE

Paper 1 Computational thinking and programming skills - C#

Friday 19 May 2023

Afternoon

Time allowed: 2 hours

Materials

- There are no additional materials required for this paper.
- You must not use a calculator.

Instructions

- Use black ink or black ball-point pen. Use pencil only for drawing.
- · Answer all questions.
- You must answer the questions in the spaces provided.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want to be marked.
- Questions that require a coded solution must be answered in C#.
- You should assume that all indexing in code starts at 0 unless stated otherwise.

Information

The total number of marks available for this paper is 90.

0 2

Figure 2 shows an algorithm that uses integer division which has been represented using pseudo-code.

• Line numbers are included but are not part of the algorithm.

Figure 2

```
again \leftarrow True
1
2
    WHILE again = True
3
       a ← USERINPUT
4
       IF a > 0 THEN
5
           counter ← 0
           WHILE a > 0
6
7
              a \leftarrow a DIV 3
8
              counter ← counter + 1
9
          ENDWHILE
10
       ELSE
11
          again + False
12
       ENDIF
13
       OUTPUT a
14 ENDWHILE
```

Integer division is the number of times one integer divides into another, with the remainder ignored.

For example:

- 14 DIV 5 evaluates to 2
- 25 DIV 3 evaluates to 8

0 2 . 1 Where is iteration first used in the algorithm in Figure 2?

Shade one lozenge.

0 6 **Figure 5** shows an algorithm represented using pseudo-code.

The algorithm is for a simple authentication routine.

The pseudo-code uses a subroutine getPassword to check a username:

- If the username exists, the subroutine returns the password stored for that user.
- If the username does not exist, the subroutine returns an empty string.

Parts of the algorithm are missing and have been replaced with the labels 11 to 14.

Figure 5

```
login ← False
REPEAT
   username ← ''
   WHILE username = ''
      OUTPUT 'Enter username: '
      username 

   ENDWHILE
   password ← ''
   WHILE password = ''
      OUTPUT 'Enter password: '
      password ← USERINPUT
   ENDWHILE
   storedPassword ← getPassword( 122 )
   IF storedPassword = 113 THEN
      OUTPUT ' 14
   ELSE
      IF password = storedPassword THEN
         login ← True
      ELSE
         OUTPUT 'Try again.'
      ENDIF
   ENDIF
UNTIL login = True
OUTPUT 'You are now logged in.'
```

Figure 6

0 7

A theme park charges £15 per person for a daily ticket. If there are six or more people in a group, the group is given a £5 discount.

Do not write outside the box

Write a C# program to calculate the total charge for a group of people visiting the theme park.

The program must:

- get the user to enter the number of people in a group
- calculate the total charge by:
 - o charging £15 per person
 - o reducing the total charge by £5 if there are six or more people
- output the total charge.

You **should** use meaningful variable name(s) and C# syntax in your answer.

The answer grid below contains vertical lines to help you indent your code.

Figure 8 shows an algorithm, written using pseudo-code, that uses a RECORD data structure for storing information about a film.

Each record stores four pieces of information about a film:

- film title
- certificate (eg 12A, PG)
- year the film was made
- if the film is currently being shown at a cinema.

There are records for three films and these films are stored alphabetically in an array called filmCollection.

The pseudo-code outputs the title of the newest of the three films.

Part of the algorithm has been replaced by the label ...

Figure 8

```
RECORD Film
   title : String
   certificate : String
   year : Integer
   beingShown : Boolean
ENDRECORD
hulk \leftarrow Film('Hulk', '12A', 2005, False)
ironMan ← Film('Iron Man', '12A', 2008, False)
antMan ← Film('Ant-Man', '12A', 2015, False)
filmCollection ← [antMan, hulk, ironMan]
year ← 0
position \leftarrow 0
FOR i \leftarrow 0 TO \blacksquare
   IF filmCollection[i].year > year THEN
      year ← filmCollection[i].year
      position ← i
   ENDIF
ENDFOR
OUTPUT filmCollection[position].title, ' is the
newest film'
```

1 1

Figure 10 shows part of an algorithm that has been written in pseudo-code.

There is an error in the algorithm.

The algorithm should:

- get the start year and end year from the user
- check that the start year is before the end year
- check that the start year is before 2000
- calculate the difference between the two years after a valid start year has been entered.
- Line numbers are included but are not part of the algorithm.

Figure 10

```
validChoice ← False
1
2
    REPEAT
3
       difference \leftarrow -1
4
       OUTPUT 'Enter a start year '
5
       startYear ← USERINPUT
6
       OUTPUT 'Enter an end year '
7
       endYear ← USERINPUT
8
       IF startYear ≥ endYear THEN
9
          OUTPUT 'Start year must be before end year'
10
       ELSE
11
           IF startYear < 2000 THEN
12
              OUTPUT 'Start year must be before 2000'
13
          ELSE
14
              validChoice ← True
15
          ENDIF
16
       ENDIF
17
    UNTIL validChoice = True
18
    difference ← endYear - startYear
19
    OUTPUT difference
```

outside the box

1 1.1 Table 1 shows three tests used to check the algorithm in Figure 10.

Complete the table to show what the values of the validChoice and difference variables would be for the given test data.

[4 marks]

Table 1

Test type	Test data		validChoice	difference
Normal	startYear	1995		
Normai	endYear	2010		
Erronoous	startYear	2015		
Erroneous	endYear	2000		
Poundon.	startYear	2000		
Boundary	endYear	2023		

1 1.2	The algorithm in Figure 10 contains a logic error on line 11.		
	Describe how the error on line 11 can be corrected.	[1 mark]	

11

Turn over for the next question

1 2.1 Figure 11 shows a binary search algorithm that has been programmed in C#.

The CompareTo method is used to compare two strings. It returns:

- −1 if the first string is less than the second
- 0 if the first string is equal to the second
- 1 if the first string is greater than the second.

Figure 11

```
string[] animals = {"cat", "dog", "hippo", "llama",
"ox", "rat", "tiger", "wolf"};
Console.Write("What animal would you like to find? ");
string animalToFind = Console.ReadLine();
bool validAnimal = false;
int start = 0;
int finish = animals.Length - 1;
while (validAnimal == false && start <= finish) {</pre>
   int mid = (start + finish) / 2;
   if (animals[mid] == animalToFind) {
      validAnimal = true; }
   else if (animalToFind.CompareTo(animals[mid]) == 1)
      start = mid + 1;
   } else {
      finish = mid - 1;
Console.WriteLine(validAnimal);
```

Complete the trace table for the program in Figure 11 if the user input is wolf

Part of the table has already been filled in.

You may not need to use all the rows in the table.

[4 marks]

animalToFind	validAnimal	start	finish	mid
wolf	False	0	7	3

1 2. 2 Figure 12 shows a line of C# code that creates an array of fruit names.

Do not write outside the box

Figure 12

Extend the program in Figure 12. Your answer must be written in C#.

The program should get the user to enter a word and perform a **linear** search on the array fruits to find if the word is in the array or not.

The program should:

- · ask the user what word they would like to find
- output the message True if the word is found
- output the message False if the word is not found.

You must write your own linear search routine and **not** use any built-in search function available in C#.

You **should** use meaningful variable name(s) and C# syntax in your answer.

The answer grid below contains vertical lines to help you indent your code.

Line 1			
Line 6			

15

Turn over for the next question

1 3

A programmer is writing a game. The game uses a 3 x 3 grid containing nine squares.

Figure 14

	A	В	С
1			
2			
3			Х

In the game, a square on the grid is referred to by a letter and a number. For example, square C3 in **Figure 14** contains an X.

Figure 15 shows part of a C# program that checks the grid reference entered by a player.

The grid reference is valid if:

- · there are exactly two characters
- the first character entered is A, B or C
- the second character entered is 1, 2 or 3.

Figure 15

```
bool check = false;
while (check == false) {
   string square = "";
   while (square.Length != 2) {
      Console.Write("Enter grid reference (eg C2): ");
      square = Console.ReadLine();
      square = square.ToUpper();
   }
```

The C# function ToUpper() converts letters into uppercase, eg b1 would be converted to B1

Extend the program from **Figure 15** so it completes the other checks needed to make sure a valid grid reference is entered.

Your extended program must:

- use the variable check
- repeat the following steps until a valid grid reference is entered:
 - o get the user to enter a grid reference
 - o output an appropriate message if the grid reference entered is not valid.

You **should** use meaningful variable name(s) and C# syntax in your answer.

The answer grid contains vertical lines to help you indent your code.

[6 marks]

bool check = false;					
<pre>while (check == false) {</pre>					
string square = "";

Console.Write("Enter grid reference (eg C2): ");					
square = Console.ReadLine();					
square = square.ToUpper();					
}					
}					

1 4 50 students have voted for the music genre they like best.

> Figure 16 shows an incomplete algorithm, represented using pseudo-code, designed to output the highest or lowest results of the vote.

The programmer has used a two-dimensional array called results to store the genre and the number of votes for each genre.

Parts of the algorithm are missing and have been replaced with the labels 11 to 15.

Figure 16

```
SUBROUTINE showResults(method, numberOfGenres)
  results ← [['Pop', 'Post-Punk', 'Techno', 'Metal',
              'Dance'], ['7', '19', '14', '1', '9']]
  pos \leftarrow 0
  high ← -1
  IF method = 'HIGHEST' THEN
     FOR i ← 0 TO numberOfGenres - 1
        IF votes > high THEN
           high ← votes
           pos ← 12
        ENDIF
     ENDFOR
  ELSE
     OUTPUT 'not yet working'
  ENDIF
  IF high \neq -1 THEN
     OUTPUT results[0][pos], 'with ', results[1][pos]
  ENDIF
ENDSUBROUTINE
OUTPUT 'Show the genre with the HIGHEST or LOWEST number
of votes? '
method ← USERINPUT
showResults([13], 5)
```

State what should be written in place of the labels to to in the algorithm in Figure 16.	Do not v outside box
[3 marks]	
6 3	9

Turn over for the next question

1 5

A group of people have a meal in a restaurant. Instead of one person paying for the whole meal, each person will pay for what they eat.

Do not write outside the box

Write a C# program that asks each person in the group how much they are paying towards the meal and works out when the bill is fully paid. Each person can pay a different amount.

The program should:

- get the user to enter the total amount of the bill
- get a person to enter how much they are paying towards the bill
- subtract the amount entered from the bill:
 - o if the amount left to pay is more than 0, output how much is left to pay and repeat until the amount left to pay is 0 or less
 - o if the amount left to pay is 0, then output the message Bill paid
 - \circ if the amount left to pay is less than 0, then output the message Tip is and the difference between the amount left to pay and 0

You **should** use meaningful variable name(s) and C# syntax in your answer.

The answer grid below contains vertical lines to help you indent your code.

1 6

Question 16 is about a dice game played against a computer.

The aim of the game is to get as close to a score of 21 as you can, without going over 21. If your score goes over 21 then you lose.

The player's score starts at 0.

For each turn:

- two dice (each numbered from 1 to 6) are rolled
- the total of the two dice rolls is added to the player's score
- the value of each dice and the player's new total score is output
- if the current score is less than 21, the player is asked if they would like to roll the dice again: if the player says yes, they get another turn; otherwise, the game ends.

At the end of the game, the program should work as follows:

- if the final score is 21, output a message to say the player has won
- if the final score is greater than 21, output a message to say the player has lost
- if the final score is less than 21, the program generates a random number between 15 and 21 inclusive:
 - if this random number is greater than the player's final score, output a message to say the player has lost
 - o otherwise, output a message to say the player has won.

Figure 17 shows the output of a program that plays this dice game.

Figure 17

```
Roll 1: 1
Roll 2: 4
Current score: 5
Would you like to roll again? yes
Roll 1: 1
Roll 2: 6
Current score: 12
Would you like to roll again? yes
Roll 1: 1
Roll 2: 2
Current score: 15
Would you like to roll again? yes
Roll 1: 6
Roll 2: 1
Current score: 22
You lost!
```

Write a C# program to simulate this game.

The first line has been written for you in the answer grid.

The dice rolls are carried out by the program generating random numbers between 1 and 6. You will need to use the C# function r.Next(a, b) which generates a random integer in the range a to b starting at a but finishing one before b.

You **should** use meaningful variable name(s) and C# syntax in your answer.

The answer grid below contains vertical lines to help you indent your code.
