State the comparisons that would be made if the binary search algorithm was used to search for the value 30 in the following array (array indices have been included above the array).

| 0 | 1 | 2  | 3  | 4  | 5  | 6  |
|---|---|----|----|----|----|----|
| 1 | 6 | 14 | 21 | 27 | 31 | 35 |

**0 3 . 1** Figure 11 shows a binary search algorithm that has been programmed in Python.

### Figure 11

```
animals = ["cat", "dog", "hippo", "llama", "ox",
"rat", "tiger", "wolf"]
animalToFind = input("What animal would you like to
find? ")
validAnimal = False
start = 0
finish = len(animals) - 1
while validAnimal == False and start <= finish:
    mid = (start + finish) // 2
    if animals[mid] == animalToFind:
        validAnimal = True
    elif animalToFind > animals[mid]:
        start = mid + 1
    else:
        finish = mid - 1
print(validAnimal)
```

Complete the trace table for the program in **Figure 11** if the user input is `wolf`

Part of the table has already been filled in.

You may not need to use all the rows in the table.

[illegible]

**0 3 . 2** **Figure 12** shows a line of Python code that creates a list of fruit names.

### Figure 12

```
fruits = ["banana", "apple", "orange", "pear",  
          "grape", "pineapple"]
```

Extend the program in **Figure 12**. Your answer must be written in Python.

The program should get the user to enter a word and perform a **linear** search on the list `fruits` to find if the word is in the list or not.

The program should:

- ask the user what word they would like to find
- output the message `True` if the word is found
- output the message `False` if the word is not found.

You must write your own linear search routine and **not** use any built-in search function available in Python.

You **should** use indentation as appropriate, meaningful variable name(s) and Python syntax in your answer.

The answer grid below contains vertical lines to help you indent your code.

**[7 marks]**

```
fruits = ["banana", "apple", "orange", "pear",  
          "grape", "pineapple"]
```

**Figure 13** shows an algorithm, represented using pseudo-code, that should display currency names in reverse alphabetical order, starting with yen.

There are errors in the logic of the algorithm.

- Line numbers are included but are not part of the algorithm.

**Figure 13**

```
1  SUBROUTINE diffCurrencies(currencies)
    currencies ← ['baht', 'dollar', 'euro',
2      'koruna', 'lira', 'rand',
      'rupee', 'yen']
3      RETURN currencies[x]
4  ENDSUBROUTINE
5
6  FOR i ← 8 TO 0 STEP 1
7      OUTPUT(diffCurrencies(i))
8  ENDFOR
```

Rewrite **line 1** and **line 6** from **Figure 13** to make the algorithm work as intended.
