

# AQA Economics AS-level

## **Macroeconomics**

### Topic 3: Economic Performance

#### **3.3 Inflation and deflation**

Notes

-  **Inflation** is the sustained rise in the general price level over time. This means that the cost of living increases and the purchasing power of money decreases.
-  **Deflation** is the opposite, where the average price level in the economy falls. There is a negative inflation rate.
-  **Disinflation** is the falling rate of inflation. This is when the average price level is still rising, but to a slower extent. This means goods and services are relatively cheaper now than a year ago, and the purchasing power of money has increased.
-  For example, a 4% increase in the price level between 2014 and 2015 would be inflation. A change from 4% to 2% is still inflation, but there has been disinflation where the price rise has slowed. If the change in the price level is now -3%, there is deflation.
-  It is important to note that deflationary government policies aim to reduce AD, and do not necessarily result in deflation.

### Causes of inflation

- **Demand pull:** This is from the demand side of the economy. When **aggregate demand** is growing unsustainably, there is pressure on resources. Producers increase their prices and earn more profits. It usually occurs when resources are fully employed.

The main triggers for demand pull inflation are:

- A depreciation in the exchange rate, which causes imports to become more expensive, whilst exports become cheaper. This causes AD to rise.
- Fiscal stimulus in the form of lower taxes or more government spending. This means consumers have more disposable income, so consumer spending increases.
- Lower interest rates makes saving less attractive and borrowing more attractive, so consumer spending increases.
- High growth in UK export markets means UK exports increase and AD increases.

- **Cost push:** This is from the supply side of the economy, and occurs when firms face rising costs. This occurs when:
  - Changes in world commodity prices can affect domestic inflation. For example, raw materials might become more expensive if oil prices rise. This increases costs of production.

- Labour becomes more expensive. This could be through trade unions, for example.
- Expectations of inflation- if consumers expect prices to rise, they may ask for higher wages to make up for this, and this could trigger more inflation.
- Indirect taxes could increase the cost of goods such as cigarettes or fuel, if producers choose to pass the costs onto the consumer.
- Depreciation in the exchange rate, which causes imports to become more expensive and pushes up the price of raw materials.
- Monopolies, using their dominant market position to exploit consumers with high prices.

### The effects of inflation on:

- **Consumers**
  - Those on low and fixed incomes are hit hardest by inflation, due to its regressive effect, because the cost of necessities such as food and water becomes expensive. The purchasing power of money falls, which affects those with high incomes the least.
  - If consumers have loans, the value of the repayment will be lower, because the amount owed does not increase with inflation, so the real value of debt decreases.
  -
- **Firms**
  - Low interest rates means borrowing and investing is more attractive than saving profits. With high inflation, interest rates are likely to be higher, so the cost of investing will be higher and firms are less likely to invest.
  - Workers might demand higher wages, which could increase the costs of production for firms.
  - Firms may be less price competitive on a global scale if inflation is high. This depends on what happens in other countries, though.
  - Unpredictable inflation will reduce business confidence, since they are not aware of what their costs will be. This could mean there is less investment.
- **The government**
  - The government will have to increase the value of the state pension and welfare payments, because the cost of living is increasing.
- **Workers**

- Real incomes fall with inflation, so workers will have less disposable income.
- If firms face higher costs, there could be more redundancies when firms try and cut their costs.
