Candidate surname					Other names				
Centre Number					Candidate Number				
<b>Pearson Edexcel Level 3 GCE</b>									
<b>Tuesday 14 May 2024</b>									
Afternoon (Time: 1 hour 45 minutes)					Paper reference		<b>8GE0/01</b>		
<b>Geography</b> <b>Advanced Subsidiary</b> <b>PAPER 1: Dynamic Landscapes</b>									
<b>You must have:</b> Resource Booklet (enclosed) Calculator, ruler								Total Marks	

### Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer Question 1 in Section A **and EITHER** Section B **OR** Section C.
- Answer the questions in the spaces provided  
– *there may be more space than you need.*
- Any **calculations** must show **all** stages of **working out** and a **clear answer**.

### Information

- The total mark for this paper is 90.
- The marks for **each** question are shown in brackets  
– *use this as a guide as to how much time to spend on each question.*
- Calculators may be used.

### Advice

- Read each question carefully before you start to answer it.
- Check your answers if you have time at the end.

**Answer Section A and EITHER Section B OR Section C.**

**SECTION A**

**Tectonic Processes and Hazards**

**Answer ALL questions. Write your answers in the spaces provided.**

**You must use the Resource Booklet provided.**

- 1** (a) Complete the missing part of the hazard risk equation.

(1)

$$\text{Risk of disaster} = \frac{\text{Event} \times \text{Vulnerability}}{\dots\dots\dots}$$

- (b) Study Figure 1 in the Resource Booklet.

- (i) Compare the distribution of aftershocks between the two earthquakes.

(2)

## SECTION B

### Glaciated Landscapes and Change

**Do not answer Section B (Glaciated Landscapes and Change) if you have answered Section C (Coastal Landscapes and Change).**

**Indicate which question you are answering by marking a cross in the box ☐. If you change your mind, put a line through the box ☒ and then indicate your new question with a cross ☐.**

**If you answer Section B, put a cross in the box ☐.**

**You must use the Resource Booklet provided.**

- 2** (a) Name **one** fluvioglacial landform.

(1)

- (b) Study Figure 2a below, which shows the change in measurements of the diameter of six stone polygons between 1991–2021.

	Expansion of the diameter (mm/yr)
Polygon 1	1.00
Polygon 2	1.13
Polygon 3	2.34
Polygon 4	1.42
Polygon 5	1.08
Polygon 6	1.23

**Figure 2a**

**Measurements of the diameter of six stone polygons**

- (i) Calculate the mean expansion of the diameter of the stone polygons.

Show your working.

Give your answer to 2 decimal places.

(2)

..... mm/yr

- (ii) Study Figure 2b in the Resource Booklet.

Suggest **one** reason for the formation of patterned ground shown.

(3)

.....

.....

.....

.....

.....

.....

- (c) Explain **two** landforms that are created by valley glacier erosion.

(4)

1 .....

.....

.....

.....

.....

2 .....

.....

.....

.....

.....

(d) Explain how distinctive landforms are created by glacial deposition.

(Total for Question 2 = 28 marks)

**3 (a)** Study Figure 3 in the Resource Booklet.

A group of students were planning fieldwork and deciding on the best time to investigate the impact of human activity on fragile glaciated landscapes near Ambleside, in the Lake District.

They consulted a website that showed them a tourism score (calculated from 1–10), which suggested months where the likely number of visitors to the area would be high or low.

- (i) Identify the month with the highest temperature.

(1)

- (ii) Describe the trend of the tourism score during the year.

(2)

- (iii) Suggest which month would be the most sensible for these students to complete their fieldwork about the impact of human activity.

(2)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

The students' investigation focussed on the impacts of human activity on the landscape.

- (iv) Explain **two** factors these students should consider before choosing their fieldwork locations.

(4)

1 .....

.....

.....

.....

2 .....

## SECTION C

## Coastal Landscapes and Change

Do not answer Section C (Coastal Landscapes and Change) if you have answered SECTION B (Glaciated Landscapes and Change)

Indicate which question you are answering by marking a cross ☐. If you change your mind, put a line through the box ☒ and then indicate your new question with a cross ☐.

If you answer Section C, put a cross in the box ☐.

You must use the Resource Booklet provided.

- 5 (a) Identify **one** landform caused by mass movement.

(1)

- (b) Study Figure 5a below, which shows the measurements taken of the volume of cliff material eroded over a six month period.

	Average volume of cliff material eroded (metres <sup>3</sup> )
August	1
September	3
October	35
November	592
December	994
January	186

**6** (a) Study Figure 6 in the Resource Booklet.

A group of students were planning fieldwork and deciding on the best time to investigate the success of coastal management approaches at Whitehaven in Cumbria.

They consulted a website that showed them a tourism score (calculated from 1–10), which suggested months where the likely number of visitors to the area would be high or low.

- (i) Identify the month with the highest temperature.

(1)

- (ii) Describe the trend of the tourism score during the year.

(2)

The students' investigation focussed on the views of tourists and residents about the visual impact of different approaches to coastal management.

- (iii) Suggest which month would be the most sensible for these students to complete their fieldwork about differing viewpoints.

**Pearson**

## SECTION A

The following resource relates to Question 1.

## Key

- Aftershocks after August 2021 Earthquake
- Aftershocks after January 2010 Earthquake
- Fault line
- Direction of plate movement
- City

**Figure 1**

**Aftershocks reported following two earthquakes in Haiti, 2010 and 2021**

**SECTION B**

The following resources relate to Question 2 and 3.

**Figure 2b**

**Patterned ground in Norway, showing stone polygons  
formed by periglacial processes**

**Figure 3**

**Temperature data and tourism score for Ambleside, Cumbria**

**The following resources relate to Question 4.**

- The Nanda Gunthi mountain is in the Chamoli region, North India. It is a tectonically active part of the Himalayas, a collision plate boundary between the Indian and Eurasian plates.
- Satellite photos show that, over four years, a large crack developed on the side of the mountain above the Raunthi Glacier. In February 2021, a rock and ice avalanche occurred.
- This rapidly moving flow of mud, water and rocks blocked the Rishiganga river, but subsequently gave way; the material then surged down the valley destroying forests, farmland and infrastructure, including hydroelectric power (HEP) stations and reservoir dams.

**Figure 4a**

**Information about the cause of the disaster**

*"This is not the first time these expensive power plants have been damaged. But HEP creates jobs and helps us find alternatives to fossil fuels."*

**Indian journalist**

*"No single event can be directly linked to climate change. However, melting glaciers uncover mountains and leave them unstable."*

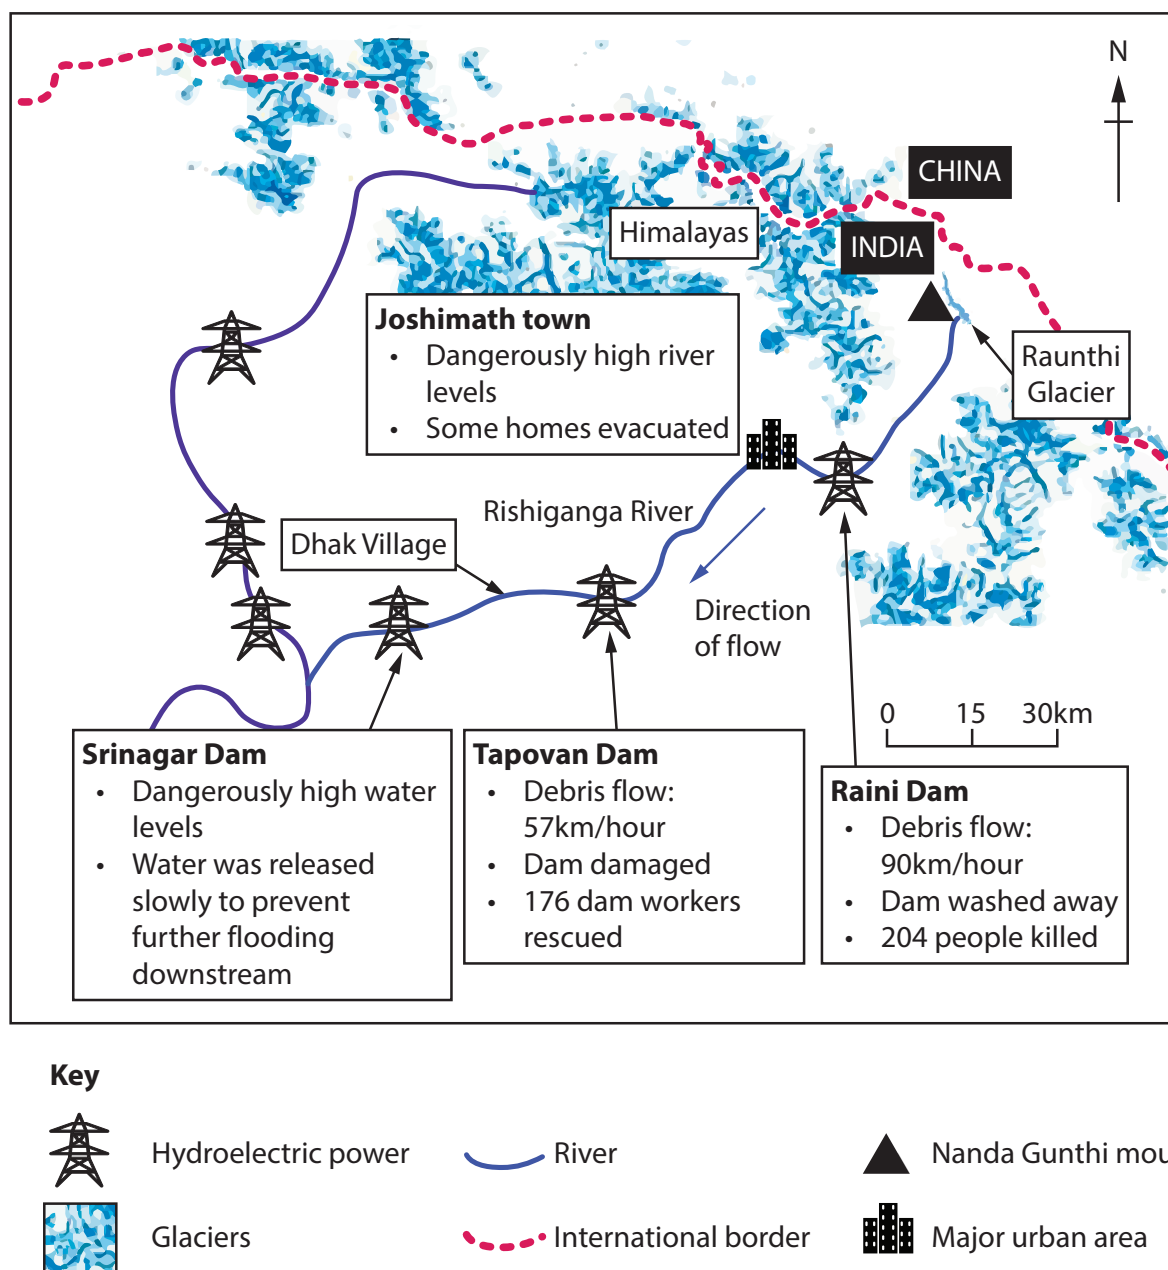

**UK landslide scientist**

*"The amount of falling rock and ice created enough friction and heat to rapidly melt the glacier – all together creating the mudflow."*

**International scientist**

**Figure 4b**

**Three viewpoints about the Chamoli disaster**

**Figure 4c**

**Selected impacts of the Chamoli disaster in February 2021**

### Nanda Gunthi Mountain

- A wedge of ice-covered rock more than 500m wide and 180m thick collapsed.
- 2.7 million m<sup>3</sup> of material fell downwards onto the glacier below.

### Tapovan Dam

- Debris including rocks over 10 metres in diameter destroyed very expensive infrastructure, including HEP stations.
- This is not the first time that HEP stations have been damaged by earthquakes and catastrophic floods in these mountain valleys.

### Dhak Village

- Early warning systems allowed many workers to seek shelter in time.
- Helicopters transported aid from nearby villages, and helped to evacuate people trapped in the narrow valleys.

**Figure 4d**

**Three scenes from the Chamoli region, February 2021**

**SECTION C**

The following resources relate to Questions 5 and 6.

**Figure 5b**

**Two images showing the coast at Porthleven, at different times of year**

**Figure 6**

**Temperature data and tourism score for Whitehaven, Cumbria**

**The following resources relate to Question 7.**

- The country of Tonga is made up of a group of 170 Pacific Islands, on a convergent plate boundary between the Indian and Australian plates. 35 of them are inhabited.
- An underwater volcano began to erupt in December 2021, allowing good time for some to evacuate. However, the shockwave from a powerful explosion on 15th January 2022 triggered a tsunami, destructive waves and temporarily raised the sea level.
- Tonga's economy relies on tourism and agriculture. It was already vulnerable to tropical cyclones. Restrictions to International visitors also slowed down the arrival of aid and therefore recovery.

**Figure 7a**

**Information about the causes of the disaster**

*"Gas, smoke and ash from the VEI 6 eruption reached 20km into the sky. The eruption could be heard 2,300km away in New Zealand."*

**International scientist**

*"Many islands in Tonga are flat leaving people with nowhere to evacuate to. Some villages are completely underwater."*

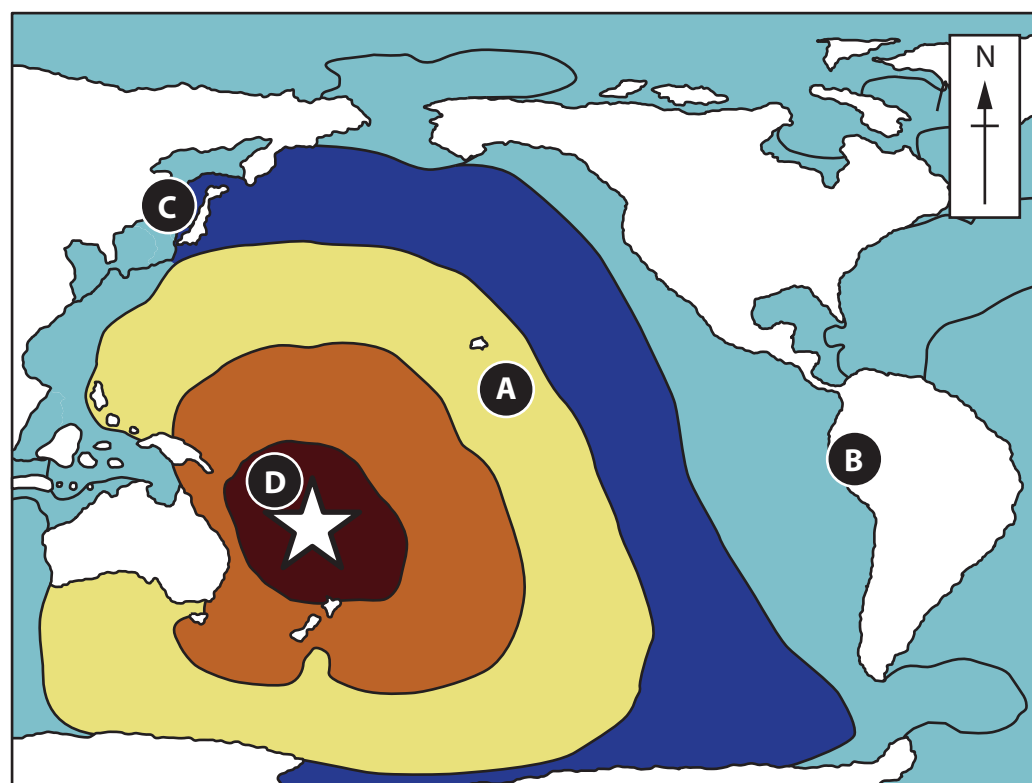

**Tongan resident**

*"It will take several days to reach Tonga and make sure people get the resources they need; we haven't been able to establish communication."*

**New Zealand Prime Minister**

**Figure 7b**

**Three viewpoints about the Tonga disaster**

0 1,250 2,500 5,000  
Kilometres

### Key

Location of the eruption

Time taken for the tsunami wave to travel

0–2 hours

3–5 hours

6–8 hours

9–11 hours

12+ hours

**A**

#### Hawaii – 5,000km away

- Tsunami wave: 0.7m high
- Some local flooding

**B**

#### Peru – 10,000km away

- Tsunami wave: 2m high
- 2 people were killed by the wave striking their car on the beach
- A ship delivering oil to a refinery was damaged resulting in an oil spill that covered almost 2,000km of coastline

**C**

#### Japan – 7,700km away

- Tsunami wave: 1m high
- 10 boats capsized
- 230,000 people evacuated to higher ground

**D**

#### Tonga

- Tsunami wave: 15m high
- 5 dead, 18 injured
- Underwater internet cable damaged
- 100 houses destroyed, 50 damaged
- Ash fall covered a large area

Figure 7c

The impact of the Tongan tsunami wave around the Pacific region

### Nomuka Island

- Many of the coastal communities of the inhabited Tongan islands were not protected by hard engineering and were flooded by the tsunami wave.
- Ash from the eruptions now covers most of the islands.

### Aid from Australia and New Zealand

- Aid flights and fresh water arrived after five days, but repairs to the damaged internet cable took months to begin.
- Damage to houses and infrastructure has left some islands uninhabitable.

### Beach resort on Tongatapu (the main island)

- Water supplies gathered from rainwater have been contaminated by ash.
- The World Bank estimates damage to the islands will cost US\$90 million, including US\$21 million of damage to agriculture and US\$63 million to tourism and infrastructure.
