

**Exercise 3C****1 a i**

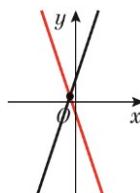

**ii**  $(2, 1)$

**b i**

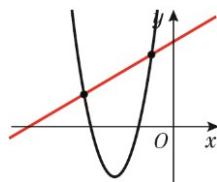

**ii**  $(3, -1)$

**c i** Rearrange  $3x + y + 1 = 0$  to give:

$$y = -3x - 1$$

**ii**  $(-0.5, 0.5)$

**2 a** Rearrange  $2y = 2x + 11$  to give  $y = x + \frac{11}{2}$ 

**b**  $(-1.5, 4)$  and  $(3.5, 9)$

**c** Substitute values for  $x$  into each equation.When  $x = -1.5$ :

$$2y = 2(-1.5) + 11 = 8, y = 4.$$

When  $x = 3.5$ :

$$2y = 2(3.5) + 11 = 18, y = 9.$$

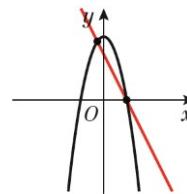

When  $x = -1.5$ :

$$y = 2(-1.5)^2 - 3(-1.5) - 5 = 4.5 + 4.5 - 5 = 4$$

When  $x = 3.5$ :

$$y = 2(3.5)^2 - 3(3.5) - 5 = 24.5 - 10.5 - 5 = 9$$

**3 a**  $y = 9 - x^2$   
 $y = -2x + 6$

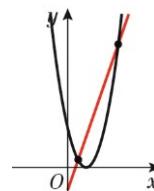

**b**  $(-1, 8)$  and  $(3, 0)$

**c** Substitute each value of  $x$  and  $y$  into each equation:  
 $(-1)^2 + 8 = 1 + 8 = 9$   
 $2(-1) + 8 = -2 + 8 = 6$   
 $(3)^2 + 0 = 9$   
 $2(3) + 0 = 6$ 

**4 a**  $y = (x - 2)^2$

$0 = (x - 2)^2$

$x = 2$

When  $x = 0, y = 4$ 

**b**  $(x - 2)^2 = 3x - 2$

$x^2 - 4x + 4 - 3x + 2 = 0$

$x^2 - 7x + 6 = 0$

$(x - 6)(x - 1) = 0$

$x = 6 \text{ or } x = 1$

When  $x = 1, y = 1$ When  $x = 6, y = 16$  $(1, 1)$  and  $(6, 16)$  are the points of intersection.

**5**  $y = x - 4$

Substitute into  $y^2 = 2x^2 - 17$ :

$$(x - 4)^2 = 2x^2 - 17$$

$$x^2 - 8x + 16 = 2x^2 - 17$$

$$0 = x^2 + 8x - 33$$

$$0 = (x + 11)(x - 3)$$

$$x = -11 \text{ or } x = 3$$

- 5** Substitute into  $y = x - 4$ :  
When  $x = -11$ ,  $y = -11 - 4 = -15$   
When  $x = 3$ ,  $y = 3 - 4 = -1$   
Intersection points:  
 $(-11, -15)$  and  $(3, -1)$

- 6**  $y = 3x - 1$   
Substitute into  $y^2 - xy = 15$ :  
 $(3x - 1)^2 - x(3x - 1) = 15$   
 $9x^2 - 6x + 1 - 3x^2 + x = 15$   
 $6x^2 - 5x - 14 = 0$   
 $(6x + 7)(x - 2) = 0$   
 $x = -\frac{7}{6}$  or  $x = 2$   
Substitute into  $y = 3x - 1$ :  
When  $x = -\frac{7}{6}$ ,  $y = -\frac{21}{6} - 1 = -\frac{9}{2}$   
When  $x = 2$ ,  $y = 6 - 1 = 5$   
Intersection points:  
 $(-\frac{7}{6}, -\frac{9}{2})$  and  $(2, 5)$

- 7 a**  $6x^2 + 3x - 7 = 2x + 8$   
 $6x^2 + x - 15 = 0$   
Using the discriminant:  
 $b^2 - 4ac = (1)^2 - 4(6)(-15) = 361$   
 $361 > 0$ , therefore there are two points of intersection.
- b**  $4x^2 - 18x + 40 = 10x - 9$   
 $4x^2 - 28x + 49 = 0$   
Using the discriminant:  
 $b^2 - 4ac = (-28)^2 - 4(4)(49) = 0$   
Thus, there is one point of intersection.
- c** Rearrange  $7x + y + 3 = 0$  to give:  
 $y = -7x - 3$   
 $3x^2 - 2x + 4 = -7x - 3$   
 $3x^2 + 5x + 7 = 0$   
Using the discriminant:  
 $b^2 - 4ac = 5^2 - 4(3)(7) = -59$   
 $-59 < 0$ , therefore there are no points of intersection.

**8 a** Rearrange  $2x - y = 1$  and then substitute into  $x^2 + 4ky + 5k = 0$ :  
 $y = 2x - 1$   
 $x^2 + 4k(2x - 1) + 5k = 0$   
 $x^2 + 8kx - 4k + 5k = 0$   
 $x^2 + 8kx + k = 0$

**b** Using the discriminant,  
 $b^2 - 4ac = 0$   
 $(8k)^2 - 4(1)(k) = 0$   
 $64k^2 - 4k = 0$   
 $4k(16k - 1) = 0$   
 $k = 0$  or  $k = \frac{1}{16}$   
As  $k$  is a non-zero constant,  $k = \frac{1}{16}$

**c**  $x^2 + 8(\frac{1}{16})x + \frac{1}{16} = 0$   
 $16x^2 + 8x + 1 = 0$   
 $(4x + 1)^2 = 0$   
 $x = -\frac{1}{4}$ ,  $y = -\frac{3}{2}$
