## GCE Examinations

## Advanced Subsidiary

## Core Mathematics C2

## Paper L

Time: 1 hour 30 minutes

## Instructions and Information

Candidates may use any calculator EXCEPT those with the facility for symbolic algebra, differentiation and / or integration.

Full marks may be obtained for answers to ALL questions.
Mathematical formulae and statistical tables are available.
This paper has nine questions.

## Advice to Candidates

You must show sufficient working to make your methods clear to an examiner. Answers without working may gain no credit.

1. A geometric series has first term 75 and second term -15 .
(a) Find the common ratio of the series.
(b) Find the sum to infinity of the series.
2. A circle has the equation

$$
x^{2}+y^{2}+8 x-4 y+k=0,
$$

where $k$ is a constant.
(a) Find the coordinates of the centre of the circle.

Given that the $x$-axis is a tangent to the circle,
(b) find the value of $k$.
3.

Figure 1
Figure 1 shows a circle of radius $r$ and centre $O$ in which $A D$ is a diameter.
The points $B$ and $C$ lie on the circle such that $O B$ and $O C$ are arcs of circles of radius $r$ with centres $A$ and $D$ respectively.

Show that the area of the shaded region $O B C$ is $\frac{1}{6} r^{2}(3 \sqrt{3}-\pi)$.
4. (a) Sketch on the same diagram the graphs of $y=\sin 2 x$ and $y=\tan \frac{x}{2}$ for $x$ in the interval $0 \leq x \leq 360^{\circ}$.
(b) Hence state how many solutions exist to the equation

$$
\sin 2 x=\tan \frac{x}{2}
$$

for $x$ in the interval $0 \leq x \leq 360^{\circ}$ and give a reason for your answer.
5. (a) Find the value of $a$ such that

$$
\begin{equation*}
\log _{a} 27=3+\log _{a} 8 \tag{3}
\end{equation*}
$$

(b) Solve the equation

$$
\begin{equation*}
2^{x+3}=6^{x-1} \tag{4}
\end{equation*}
$$

giving your answer to 3 significant figures.
6. (a) Expand $(2+x)^{4}$ in ascending powers of $x$, simplifying each coefficient.
(b) Find the integers $A, B$ and $C$ such that

$$
\begin{equation*}
(2+x)^{4}+(2-x)^{4} \equiv A+B x^{2}+C x^{4} . \tag{2}
\end{equation*}
$$

(c) Find the real values of $x$ for which

$$
\begin{equation*}
(2+x)^{4}+(2-x)^{4}=136 . \tag{3}
\end{equation*}
$$

7. 

$$
\mathrm{f}(x)=2 x^{3}-5 x^{2}+x+2
$$

(a) Show that $(x-2)$ is a factor of $\mathrm{f}(x)$.
(b) Fully factorise $\mathrm{f}(x)$.
(c) Solve the equation $\mathrm{f}(x)=0$.
(d) Find the values of $\theta$ in the interval $0 \leq \theta \leq 2 \pi$ for which

$$
2 \sin ^{3} \theta-5 \sin ^{2} \theta+\sin \theta+2=0
$$

giving your answers in terms of $\pi$.
8. The curve $C$ has the equation

$$
y=3-x^{\frac{1}{2}}-2 x^{-\frac{1}{2}}, x>0
$$

(a) Find the coordinates of the points where $C$ crosses the $x$-axis.
(b) Find the exact coordinates of the stationary point of $C$.
(c) Determine the nature of the stationary point.
(d) Sketch the curve $C$.
9.

Figure 2
Figure 2 shows the curve $C$ with equation $y=3 x-4 \sqrt{x}+2$ and the tangent to $C$ at the point $A$.

Given that $A$ has $x$-coordinate 4,
(a) show that the tangent to $C$ at $A$ has the equation $y=2 x-2$.

The shaded region is bounded by $C$, the tangent to $C$ at $A$ and the positive coordinate axes.
(b) Find the area of the shaded region.
