## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise A, Question 1

## Question:

Find $\frac{d y}{d x}$ for each of the following, leaving your answer in terms of the parameter $t$ :
(a) $x=2 t, y=t^{2}-3 t+2$
(b) $x=3 t^{2}, y=2 t^{3}$
(c) $x=t+3 t^{2}, y=4 t$
(d) $x=t^{2}-2, y=3 t^{5}$
(e) $x=\frac{2}{t}, y=3 t^{2}-2$
(f) $x=\frac{1}{2 t-1}, y=\frac{t^{2}}{2 t-1}$
(g) $x=\frac{2 t}{1+t^{2}}, y=\frac{1-t^{2}}{1+t^{2}}$
(h) $x=t^{2} \mathrm{e}^{t}, y=2 t$
(i) $x=4 \sin 3 t, y=3 \cos 3 t$
(j) $x=2+\sin t, y=3-4 \cos t$
(k) $x=\sec t, y=\tan t$
(1) $x=2 t-\sin 2 t, y=1-\cos 2 t$

## Solution:

(a) $x=2 t, y=t^{2}-3 t+2$

$$
\frac{\mathrm{d} x}{\mathrm{~d} t}=2, \frac{\mathrm{~d} y}{\mathrm{~d} t}=2 t-3
$$

Using the chain rule

$$
\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{\left(\frac{\mathrm{d} y}{\mathrm{~d} t}\right)}{\left(\frac{\mathrm{d} x}{\mathrm{~d} t}\right)}=\frac{2 t-3}{2}
$$

(b) $x=3 t^{2}, y=2 t^{3}$

$$
\frac{\mathrm{d} x}{\mathrm{~d} t}=6 t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=6 t^{2}
$$

Using the chain rule

$$
\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{\left(\frac{\mathrm{d} y}{\mathrm{~d} t}\right)}{\left(\frac{\mathrm{d} x}{\mathrm{~d} t}\right)}=\frac{6 t^{2}}{6 t}=t
$$

(c) $x=t+3 t^{2}, y=4 t$

$$
\frac{\mathrm{d} x}{\mathrm{~d} t}=1+6 t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=4
$$

$$
\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{4}{1+6 t} \quad \text { (from the chain rule) }
$$

(d) $x=t^{2}-2, y=3 t^{5}$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=2 t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=15 t^{4}$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{15 t^{4}}{2 t}=\frac{15 t^{3}}{2} \quad$ (from the chain rule)
(e) $x=\frac{2}{t}, y=3 t^{2}-2$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=-2 t^{-2}, \frac{\mathrm{~d} y}{\mathrm{~d} t}=6 t$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{6 t}{-2 t^{-2}}=-3 t^{3} \quad$ (from the chain rule)
(f) $x=\frac{1}{2 t-1}, y=\frac{t^{2}}{2 t-1}$

As $x=(2 t-1)^{-1}, \frac{\mathrm{~d} x}{\mathrm{~d} t}=-2(2 t-1)^{-2} \quad$ (from the chain rule)
Use the quotient rule to give

$$
\frac{\mathrm{d} y}{\mathrm{~d} t}=\frac{(2 t-1)(2 t)-t^{2}(2)}{(2 t-1)^{2}}=\frac{2 t^{2}-2 t}{(2 t-1)^{2}}=\frac{2 t(t-1)}{(2 t-1)^{2}}
$$

Hence $\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{\left(\frac{\mathrm{d} y}{\mathrm{~d} t}\right)}{\left(\frac{\mathrm{d} x}{\mathrm{~d} t}\right)}$

$$
\begin{aligned}
& =\frac{2 t(t-1)}{(2 t-1)^{2}} \div-2(2 t-1)^{-2} \\
& =\frac{2 t(t-1)}{(2 t-1)^{2}} \div \frac{-2}{(2 t-1)^{2}} \\
& =\frac{2 t(t-1)}{(2 t-1)^{2}} \times \frac{(2 t-1)^{2}}{-2} \\
& =-t(t-1) \text { or } t(1-t)
\end{aligned}
$$

(g) $x=\frac{2 t}{1+t^{2}}, y=\frac{1-t^{2}}{1+t^{2}}$

$$
\frac{\mathrm{d} x}{\mathrm{~d} t}=\frac{\left(1+t^{2}\right) 2-2 t(2 t)}{\left(1+t^{2}\right)^{2}}=\frac{2-2 t^{2}}{\left(1+t^{2}\right)^{2}}
$$

and

$$
\frac{\mathrm{d} y}{\mathrm{~d} t}=\frac{\left(1+t^{2}\right)(-2 t)-\left(1-t^{2}\right)(2 t)}{\left(1+t^{2}\right)^{2}}=\frac{-4 t}{\left(1+t^{2}\right)^{2}}
$$

Hence

$$
\begin{aligned}
\frac{\mathrm{d} y}{\mathrm{~d} x} & =\frac{\left(\frac{\mathrm{d} y}{\mathrm{~d} t}\right)}{\left(\frac{\mathrm{d} x}{\mathrm{~d} t}\right)} \\
& =\frac{-4 t}{\left(1+t^{2}\right)^{2}} \div \frac{2-2 t^{2}}{\left(1+t^{2}\right)^{2}} \\
& =\frac{-4 t}{2\left(1-t^{2}\right)} \\
& =-\frac{2 t}{\left(1-t^{2}\right)} \text { or } \frac{2 t}{t^{2}-1}
\end{aligned}
$$

(h) $x=t^{2} \mathrm{e}^{t}, y=2 t$

$$
\frac{\mathrm{d} x}{\mathrm{~d} t}=t^{2} \mathrm{e}^{t}+\mathrm{e}^{t} 2 t \text { (from the product rule) and } \frac{\mathrm{d} y}{\mathrm{~d} t}=2
$$

$$
\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2}{t^{2} \mathrm{e}^{t}+2 t \mathrm{e}^{t}}=\frac{2}{t \mathrm{e}^{t}(t+2)} \quad \text { (from the chain rule) }
$$

(i) $x=4 \sin 3 t, y=3 \cos 3 t$

$$
\begin{aligned}
& \frac{\mathrm{d} x}{\mathrm{~d} t}=12 \cos 3 t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=-9 \sin 3 t \\
& \therefore \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{-9 \sin 3 t}{12 \cos 3 t}=-\frac{3}{4} \tan 3 t \quad \text { (from the chain rule) }
\end{aligned}
$$

(j) $x=2+\sin t, y=3-4 \cos t$

$$
\frac{\mathrm{d} x}{\mathrm{~d} t}=\cos t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=4 \sin t
$$

$$
\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{4 \sin t}{\cos t}=4 \tan t \quad \text { (from the chain rule) }
$$

(k) $x=\sec t, y=\tan t$

$$
\frac{\mathrm{d} x}{\mathrm{~d} t}=\sec t \tan t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=\sec ^{2} t
$$

Hence $\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{\sec ^{2} t}{\sec t \tan t}$

$$
\begin{aligned}
& =\frac{\sec t}{\tan t} \\
& =\frac{1}{\cos t} \times \frac{\cos t}{\sin t} \\
& =\frac{1}{\sin t} \\
& =\operatorname{cosec} t
\end{aligned}
$$

(1) $x=2 t-\sin 2 t, y=1-\cos 2 t$

$$
\frac{\mathrm{d} x}{\mathrm{~d} t}=2-2 \cos 2 t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=2 \sin 2 t
$$

Hence $\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2 \sin 2 t}{2-2 \cos 2 t}$

$$
\begin{aligned}
& =\frac{2 \times 2 \sin t \cos t}{2-2\left(1-2 \sin ^{2} t\right)} \quad \text { (using double angle formulae) } \\
& =\frac{\sin t \cos t}{\sin ^{2} t} \\
& =\frac{\cos t}{\sin t} \\
& =\cot t
\end{aligned}
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise A, Question 2

## Question:

(a) Find the equation of the tangent to the curve with parametric equations $x=3 t-2 \sin t, y=t^{2}+t \cos t$, at the point $P$, where $t=\frac{\pi}{2}$.
(b) Find the equation of the tangent to the curve with parametric equations $x=9-t^{2}, y=t^{2}+6 t$, at the point $P$, where $t=2$.

## Solution:

(a) $x=3 t-2 \sin t, y=t^{2}+t \cos t$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=3-2 \cos t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=2 t+(-t \sin t+\cos t)$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2 t-t \sin t+\cos t}{3-2 \cos t}$
When $t=\frac{\pi}{2}, \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{\left(\pi-\frac{\pi}{2}\right)}{3}=\frac{\pi}{6}$
$\therefore$ the tangent has gradient $\frac{\pi}{6}$.
When $t=\frac{\pi}{2}, x=\frac{3 \pi}{2}-2$ and $y=\frac{\pi^{2}}{4}$
$\therefore$ the tangent passes through the point $\left(\frac{3 \pi}{2}-2, \frac{\pi^{2}}{4}\right)$
The equation of the tangent is
$y-\frac{\pi^{2}}{4}=\frac{\pi}{6}\left[x-\left(\frac{3 \pi}{2}-2\right)\right]$
$\therefore y-\frac{\pi^{2}}{4}=\frac{\pi}{6} x-\frac{\pi^{2}}{4}+\frac{\pi}{3}$
i.e. $y=\frac{\pi}{6} x+\frac{\pi}{3}$
(b) $x=9-t^{2}, y=t^{2}+6 t$

$$
\begin{aligned}
& \frac{\mathrm{d} x}{\mathrm{~d} t}=-2 t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=2 t+6 \\
& \therefore \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{2 t+6}{-2 t}
\end{aligned}
$$

At the point where $t=2, \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{10}{-4}=\frac{-5}{2}$
Also at $t=2, x=5$ and $y=16$.
$\therefore$ the tangent has equation

$$
\begin{aligned}
& y-16=\frac{-5}{2}(x-5) \\
& \therefore 2 y-32=-5 x+25 \\
& \text { i.e. } 2 y+5 x=57
\end{aligned}
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise A, Question 3

## Question:

(a) Find the equation of the normal to the curve with parametric equations $x=\mathrm{e}^{t}, y=\mathrm{e}^{t}+\mathrm{e}^{-t}$, at the point $P$, where $t=0$.
(b) Find the equation of the normal to the curve with parametric equations $x=1-\cos 2 t, y=\sin 2 t$, at the point $P$, where $t=\frac{\pi}{6}$.

## Solution:

(a) $x=\mathrm{e}^{t}, y=\mathrm{e}^{t}+\mathrm{e}^{-t}$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=\mathrm{e}^{t}$ and $\frac{\mathrm{d} y}{\mathrm{~d} t}=\mathrm{e}^{t}-\mathrm{e}^{-t}$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{\mathrm{e}^{t}-\mathrm{e}^{-t}}{\mathrm{e}^{t}}$
When $t=0, \frac{\mathrm{~d} y}{\mathrm{~d} x}=0$
$\therefore$ gradient of curve is 0
$\therefore$ normal is parallel to the $y$-axis.
When $t=0, x=1$ and $y=2$
$\therefore$ equation of the normal is $x=1$
(b) $x=1-\cos 2 t, y=\sin 2 t$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=2 \sin 2 t$ and $\frac{\mathrm{d} y}{\mathrm{~d} t}=2 \cos 2 t$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2 \cos 2 t}{2 \sin 2 t}=\cot 2 t$

When $t=\frac{\pi}{6}, \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{1}{\tan \frac{\pi}{3}}=\frac{1}{\sqrt{ } 3}$
$\therefore$ gradient of the normal is $-\sqrt{ } 3$
When $t=\frac{\pi}{6}, x=1-\cos \frac{\pi}{3}=\frac{1}{2}$ and $y=\sin \frac{\pi}{3}=\frac{\sqrt{ } 3}{2}$
$\therefore$ equation of the normal is

$$
\begin{aligned}
& y-\frac{\sqrt{ } 3}{2}=-\sqrt{ } 3\left(x-\frac{1}{2}\right) \\
& \text { i.e. } y-\frac{\sqrt{ } 3}{2}=-\sqrt{ } 3 x+\frac{\sqrt{ } 3}{2} \\
& \therefore y+\sqrt{ } 3 x=\sqrt{ } 3
\end{aligned}
$$

## Differentiation

Exercise A, Question 4

## Question:

Find the points of zero gradient on the curve with parametric equations $x=$ $\frac{t}{1-t}, y=\frac{t^{2}}{1-t}, t \neq 1$.
You do not need to establish whether they are maximum or minimum points.

## Solution:

$x=\frac{t}{1-t}, y=\frac{t^{2}}{1-t}$
Use the quotient rule to give
$\frac{\mathrm{d} x}{\mathrm{~d} t}=\frac{(1-t) \times 1-t(-1)}{(1-t)^{2}}=\frac{1}{(1-t)^{2}}$
and
$\frac{\mathrm{d} y}{\mathrm{~d} t}=\frac{(1-t) 2 t-t^{2}(-1)}{(1-t)^{2}}=\frac{2 t-t^{2}}{(1-t)^{2}}$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2 t-t^{2}}{(1-t)^{2}} \div \frac{1}{(1-t)^{2}}=t(2-t)$
When $\frac{\mathrm{d} y}{\mathrm{~d} x}=0, t=0$ or 2
When $t=0$ then $x=0, y=0$
When $t=2$ then $x=-2, y=-4$
$\therefore(0,0)$ and $(-2,-4)$ are the points of zero gradient.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise B, Question 1

## Question:

Find an expression in terms of $x$ and $y$ for $\frac{\mathrm{d} y}{\mathrm{~d} x}$, given that:
(a) $x^{2}+y^{3}=2$
(b) $x^{2}+5 y^{2}=14$
(c) $x^{2}+6 x-8 y+5 y^{2}=13$
(d) $y^{3}+3 x^{2} y-4 x=0$
(e) $3 y^{2}-2 y+2 x y=x^{3}$
(f) $x=\frac{2 y}{x^{2}-y}$
(g) $(x-y)^{4}=x+y+5$
(h) $\mathrm{e}^{x} y=x \mathrm{e}^{y}$
(i) $\sqrt{(x y)}+x+y^{2}=0$

## Solution:

(a) $x^{2}+y^{3}=2$

Differentiate with respect to $x$ :

$$
\begin{aligned}
& 2 x+3 y^{2} \frac{\mathrm{~d} y}{\mathrm{~d} x}=0 \\
& \therefore \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{-2 x}{3 y^{2}}
\end{aligned}
$$

(b) $x^{2}+5 y^{2}=14$

$$
2 x+10 y \frac{\mathrm{~d} y}{\mathrm{~d} x}=0
$$

$$
\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{-2 x}{10 y}=-\frac{x}{5 y}
$$

(c) $x^{2}+6 x-8 y+5 y^{2}=13$
$2 x+6-8 \frac{\mathrm{~d} y}{\mathrm{~d} x}+10 y \frac{\mathrm{~d} y}{\mathrm{~d} x}=0$
$2 x+6=(8-10 y) \frac{\mathrm{d} y}{\mathrm{~d} x}$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2 x+6}{8-10 y}=\frac{x+3}{4-5 y}$
(d) $y^{3}+3 x^{2} y-4 x=0$

Differentiate with respect to $x$ :
$3 y^{2} \frac{\mathrm{~d} y}{\mathrm{~d} x}+\left(3 x^{2} \frac{\mathrm{~d} y}{\mathrm{~d} x}+y \times 6 x\right)-4=0$
$\frac{\mathrm{d} y}{\mathrm{~d} x}\left(3 y^{2}+3 x^{2}\right)=4-6 x y$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{4-6 x y}{3\left(x^{2}+y^{2}\right)}$
(e) $3 y^{2}-2 y+2 x y-x^{3}=0$
$6 y \frac{\mathrm{~d} y}{\mathrm{~d} x}-2 \frac{\mathrm{~d} y}{\mathrm{~d} x}+\left(2 x \frac{\mathrm{~d} y}{\mathrm{~d} x}+y \times 2\right)-3 x^{2}=0$
$\frac{\mathrm{d} y}{\mathrm{~d} x}(6 y-2+2 x)=3 x^{2}-2 y$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{3 x^{2}-2 y}{2 x+6 y-2}$
(f) $x=\frac{2 y}{x^{2}-y}$
$\therefore x^{3}-x y=2 y$
i.e. $x^{3}-x y-2 y=0$

Differentiate with respect to $x$ :
$3 x^{2}-\left(x \frac{\mathrm{~d} y}{\mathrm{~d} x}+y \times 1\right)-2 \frac{\mathrm{~d} y}{\mathrm{~d} x}=0$
$3 x^{2}-y=\frac{\mathrm{d} y}{\mathrm{~d} x}(x+2)$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{3 x^{2}-y}{x+2}$
(g) $(x-y)^{4}=x+y+5$

Differentiate with respect to $x$ :
$4(x-y)^{3}\left(1-\frac{\mathrm{d} y}{\mathrm{~d} x}\right)=1+\frac{\mathrm{d} y}{\mathrm{~d} x}$ (The chain rule was used to differentiate the first
term.)

$$
\begin{aligned}
& \therefore 4(x-y)^{3}-1=\frac{\mathrm{d} y}{\mathrm{~d} x}\left[1+4(x-y)^{3}\right] \\
& \therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{4(x-y)^{3}-1}{1+4(x-y)^{3}}
\end{aligned}
$$

(h) $\mathrm{e}^{x} y=x \mathrm{e}^{y}$

Differentiate with respect to $x$ :

$$
\begin{aligned}
& \mathrm{e}^{x} \frac{\mathrm{~d} y}{\mathrm{~d} x}+y \mathrm{e}^{x}=x \mathrm{e}^{y} \frac{\mathrm{dy}}{\mathrm{~d} x}+\mathrm{e}^{y} \times 1 \\
& \mathrm{e}^{x} \frac{\mathrm{~d} y}{\mathrm{~d} x}-x \mathrm{e}^{y} \frac{\mathrm{~d} y}{\mathrm{~d} x}=\mathrm{e}^{y}-y \mathrm{e}^{x} \\
& \frac{\mathrm{~d} y}{\mathrm{~d} x}\left(\mathrm{e}^{x}-x \mathrm{e}^{y}\right)=\mathrm{e}^{y}-y \mathrm{e}^{x} \\
& \therefore \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{\mathrm{e}^{y}-y \mathrm{e}^{x}}{\mathrm{e}^{x}-x \mathrm{e}^{y}}
\end{aligned}
$$

(i) $\sqrt{x y}+x+y^{2}=0$

Differentiate with respect to $x$ :

$$
\frac{1}{2}(x y)-\frac{1}{2}\left(x \frac{\mathrm{~d} y}{\mathrm{~d} x}+y \times 1\right)+1+2 y \frac{\mathrm{~d} y}{\mathrm{~d} x}=0
$$

Multiply both sides by $2 \sqrt{x y}$ :

$$
\begin{aligned}
& \left(x \frac{\mathrm{~d} y}{\mathrm{~d} x}+y\right)+2 \sqrt{x y}+4 y \sqrt{x y} \frac{\mathrm{~d} y}{\mathrm{~d} x}=0 \\
& \frac{\mathrm{~d} y}{\mathrm{~d} x}(x+4 y \sqrt{x y})=-(2 \sqrt{x y}+y) \\
& \therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{-(2 \sqrt{x y}+y)}{x+4 y \sqrt{x y}} .
\end{aligned}
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise B, Question 2

## Question:

Find the equation of the tangent to the curve with implicit equation $x^{2}+3 x y^{2}-y^{3}=9$ at the point $(2,1)$.

## Solution:

$x^{2}+3 x y^{2}-y^{3}=9$
Differentiate with respect to $x$ :
$2 x+\left[3 x\left(2 y \frac{\mathrm{~d} y}{\mathrm{~d} x}\right)+y^{2} \times 3\right]-3 y^{2} \frac{\mathrm{~d} y}{\mathrm{~d} x}=0$
When $x=2$ and $y=1$
$4+\left(12 \frac{\mathrm{~d} y}{\mathrm{~d} x}+3\right)-3 \frac{\mathrm{~d} y}{\mathrm{~d} x}=0$
$\therefore 9 \frac{\mathrm{~d} y}{\mathrm{~d} x}=-7$
i.e. $\frac{d y}{d x}=\frac{-7}{9}$
$\therefore$ the gradient of the tangent at $(2,1)$ is $\frac{-7}{9}$.
The equation of the tangent is

$$
\begin{aligned}
& (y-1)=\frac{-7}{9}(x-2) \\
& \therefore 9 y-9=-7 x+14 \\
& \therefore 9 y+7 x=23
\end{aligned}
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise B, Question 3

## Question:

Find the equation of the normal to the curve with implicit equation $(x+y)^{3}=x^{2}+y$ at the point $(1,0)$.

## Solution:

$$
(x+y)^{3}=x^{2}+y
$$

Differentiate with respect to $x$ :
$3(x+y)^{2}\left(1+\frac{\mathrm{d} y}{\mathrm{~d} x}\right)=2 x+\frac{\mathrm{d} y}{\mathrm{~d} x}$
At the point $(1,0), x=1$ and $y=0$
$\therefore 3\left(1+\frac{\mathrm{d} y}{\mathrm{~d} x}\right)=2+\frac{\mathrm{d} y}{\mathrm{~d} x}$
$\therefore 2 \frac{\mathrm{~d} y}{\mathrm{~d} x}=-1 \Rightarrow \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{-1}{2}$
$\therefore$ The gradient of the normal at $(1,0)$ is 2 .
$\therefore$ the equation of the normal is
$y-0=2(x-1)$
i.e. $y=2 x-2$
© Pearson Education Ltd 2009

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise B, Question 4

## Question:

Find the coordinates of the points of zero gradient on the curve with implicit equation $x^{2}+4 y^{2}-6 x-16 y+21=0$.

## Solution:

$$
\begin{equation*}
x^{2}+4 y^{2}-6 x-16 y+21=0 \tag{1}
\end{equation*}
$$

Differentiate with respect to $x$ :

$$
\begin{aligned}
& 2 x+8 y \frac{\mathrm{~d} y}{\mathrm{~d} x}-6-16 \frac{\mathrm{~d} y}{\mathrm{~d} x}=0 \\
& 8 y \frac{\mathrm{~d} y}{\mathrm{~d} x}-16 \frac{\mathrm{~d} y}{\mathrm{~d} x}=6-2 x \\
& (8 y-16) \frac{\mathrm{d} y}{\mathrm{~d} x}=6-2 x \\
& \therefore \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{6-2 x}{8 y-16}
\end{aligned}
$$

For zero gradient $\frac{\mathrm{d} y}{\mathrm{~d} x}=0 \Rightarrow 6-2 x=0 \Rightarrow x=3$
Substitute $x=3$ into (1) to give

$$
\begin{aligned}
& 9+4 y^{2}-18-16 y+21=0 \\
& \Rightarrow \quad 4 y^{2}-16 y+12=0[\div 4] \\
& \Rightarrow \quad y^{2}-4 y+3=0 \\
& \Rightarrow \quad(y-1)(y-3)=0 \\
& \Rightarrow \quad y=1 \text { or } 3
\end{aligned}
$$

$\therefore$ the coordinates of the points of zero gradient are $(3,1)$ and $(3,3)$.

## Differentiation

Exercise C, Question 1

## Question:

Find $\frac{d y}{d x}$ for each of the following:
(a) $y=3^{x}$
(b) $y=\left(\frac{1}{2}\right) x$
(c) $y=x a^{x}$
(d) $y=\frac{2^{x}}{x}$

## Solution:

(a) $y=3^{x}$

$$
\frac{\mathrm{d} y}{\mathrm{~d} x}=3^{x} \ln 3
$$

(b) $y=\left(\frac{1}{2}\right) x$
$\frac{\mathrm{d} y}{\mathrm{~d} x}=\left(\frac{1}{2}\right){ }^{x} \ln \frac{1}{2}$
(c) $y=x a^{x}$

Use the product rule to give
$\frac{\mathrm{d} y}{\mathrm{~d} x}=x a^{x} \ln a+a^{x} \times 1=a^{x}(x \ln a+1)$
(d) $y=\frac{2^{x}}{x}$

Use the quotient rule to give
$\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{x \times 2^{x} \ln 2-2^{x} \times 1}{x^{2}}=\frac{2^{x}(x \ln 2-1)}{x^{2}}$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise C, Question 2

## Question:

Find the equation of the tangent to the curve $y=2^{x}+2^{-x}$ at the point $(2,4$ $\left.\frac{1}{4}\right)$.

## Solution:

$y=2^{x}+2^{-x}$
$\frac{\mathrm{d} y}{\mathrm{~d} x}=2^{x} \ln 2-2^{-x} \ln 2$
When $x=2, \frac{\mathrm{~d} y}{\mathrm{~d} x}=4 \ln 2-\frac{1}{4} \ln 2=\frac{15}{4} \ln 2$
$\therefore$ the equation of the tangent at $\left(2,4 \frac{1}{4}\right)$ is
$y-4 \frac{1}{4}=\frac{15}{4} \ln 2(x-2)$
$\therefore 4 y=(15 \ln 2) x+(17-30 \ln 2)$

Exercise C, Question 3

## Question:

A particular radioactive isotope has an activity $R$ millicuries at time $t$ days given by the equation $R=200(0.9)^{t}$. Find the value of $\frac{\mathrm{d} R}{\mathrm{~d} t}$, when $t=8$.

## Solution:

$R=200(0.9){ }^{t}$
$\frac{\mathrm{d} R}{\mathrm{~d} t}=200 \times \ln 0.9 \times(0.9)^{t}$
Substitute $t=8$ to give
$\frac{\mathrm{d} R}{\mathrm{~d} t}=-9.07$ (3 s.f.)

Exercise C, Question 4

## Question:

The population of Cambridge was 37000 in 1900 and was about 109000 in 2000. Find an equation of the form $P=P_{0} k^{t}$ to model this data, where $t$ is measured as years since 1900 . Evaluate $\frac{\mathrm{d} P}{\mathrm{~d} t}$ in the year 2000. What does this value represent?

## Solution:

$P=P_{0} k^{t}$
When $t=0, P=37000$
$\therefore 37000=P_{0} \times k^{0}=P_{0} \times 1$
$\therefore P_{0}=37000$
$\therefore P=37000(k)^{t}$
When $t=100, P=109000$
$\therefore 109000=37000(k)^{100}$
$\therefore k^{100}=\frac{109000}{37000}$
$\therefore k=100 \sqrt{\frac{109}{37}} \approx 1.01$
$\frac{\mathrm{d} P}{\mathrm{~d} t}=37000 k^{t} \ln k$
When $t=100$
$\frac{\mathrm{d} P}{\mathrm{~d} t}=37000 \times\left(\frac{109}{37}\right) \times \ln k=1000 \times 109 \times \frac{1}{100} \ln \frac{109}{37}$
$=1178$ people per year
Rate of increase of the population during the year 2000.

## Differentiation

Exercise D, Question 1

## Question:

Given that $V=\frac{1}{3} \pi r^{3}$ and that $\frac{\mathrm{d} V}{\mathrm{~d} t}=8$, find $\frac{\mathrm{d} r}{\mathrm{~d} t}$ when $r=3$.

## Solution:

$V=\frac{1}{3} \pi r^{3}$

$$
\therefore \frac{\mathrm{d} V}{\mathrm{~d} r}=\pi r^{2}
$$

Using the chain rule
$\frac{\mathrm{d} V}{\mathrm{~d} t}=\frac{\mathrm{d} V}{\mathrm{~d} r} \times \frac{\mathrm{d} r}{\mathrm{~d} t}$
$\therefore 8=\pi r^{2} \times \frac{\mathrm{d} r}{\mathrm{~d} t}$
$\therefore \frac{\mathrm{d} r}{\mathrm{~d} t}=\frac{8}{\pi r^{2}}$
When $r=3, \frac{\mathrm{~d} r}{\mathrm{~d} t}=\frac{8}{9 \pi}$

Exercise D, Question 4

## Question:

Given that $r=1+3 \cos \theta$ and that $\frac{\mathrm{d} \theta}{\mathrm{d} t}=3$, find $\frac{\mathrm{d} r}{\mathrm{~d} t}$ when $\theta=\frac{\pi}{6}$.

## Solution:

$r=1+3 \cos \theta$
$\frac{\mathrm{d} r}{\mathrm{~d} \theta}=-3 \sin \theta$
Using the chain rule
$\frac{\mathrm{d} r}{\mathrm{~d} t}=\frac{\mathrm{d} r}{\mathrm{~d} \theta} \times \frac{\mathrm{d} \theta}{\mathrm{d} t}=-3 \sin \theta \times 3=-9 \sin \theta$
When $\theta=\frac{\pi}{6}, \frac{\mathrm{~d} r}{\mathrm{~d} t}=\frac{-9}{2}$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise E, Question 1

## Question:

In a study of the water loss of picked leaves the mass $M$ grams of a single leaf was measured at times $t$ days after the leaf was picked. It was found that the rate of loss of mass was proportional to the mass $M$ of the leaf.
Write down a differential equation for the rate of change of mass of the leaf.

## Solution:

$\frac{\mathrm{d} M}{\mathrm{~d} t}$ represents rate of change of mass.
$\therefore \frac{\mathrm{d} M}{\mathrm{~d} t} \propto-M$, as rate of loss indicates a negative quantity.
$\therefore \frac{\mathrm{d} M}{\mathrm{~d} t}=-k M$, where $k$ is the positive constant of proportionality.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise E, Question 2

## Question:

A curve $C$ has equation $y=\mathrm{f}(x), y>0$. At any point $P$ on the curve, the gradient of $C$ is proportional to the product of the $x$ and the $y$ coordinates of $P$.
The point $A$ with coordinates $(4,2)$ is on $C$ and the gradient of $C$ at $A$ is $\frac{1}{2}$.
Show that $\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{x y}{16}$.

## Solution:

The gradient of the curve is given by $\frac{d y}{d x}$.
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x} \propto x y \quad$ (which is the product of $x$ and $y$ )
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=k x y$, where $k$ is a constant of proportion.
When $x=4, y=2$ and $\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{1}{2}$
$\therefore \frac{1}{2}=k \times 4 \times 2$
$\therefore k=\frac{1}{16}$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{x y}{16}$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise E, Question 3

## Question:

Liquid is pouring into a container at a constant rate of $30 \mathrm{~cm}^{3} \mathrm{~s}^{-1}$. At time $t$ seconds liquid is leaking from the container at a rate of $\frac{2}{15} V \mathrm{~cm}^{3} \mathrm{~s}^{-1}$, where $V \mathrm{~cm}^{3}$ is the volume of liquid in the container at that time.
Show that $-15 \frac{\mathrm{~d} V}{\mathrm{~d} t}=2 \mathrm{~V}-450$

## Solution:

Let the rate of increase of the volume of liquid be $\frac{\mathrm{d} V}{\mathrm{~d} t}$.
Then $\frac{\mathrm{d} V}{\mathrm{~d} t}=30-\frac{2}{15} V$
Multiply both sides by -15 :
$-15 \frac{\mathrm{~d} V}{\mathrm{~d} t}=2 V-450$

## Differentiation

Exercise E, Question 4

## Question:

An electrically charged body loses its charge $Q$ coulombs at a rate, measured in coulombs per second, proportional to the charge $Q$.
Write down a differential equation in terms of $Q$ and $t$ where $t$ is the time in seconds since the body started to lose its charge.

## Solution:

The rate of change of the charge is $\frac{\mathrm{d} Q}{\mathrm{~d} t}$.
$\therefore \frac{\mathrm{d} Q}{\mathrm{~d} t} \propto-Q$, as the body is losing charge the negative sign is required.
$\therefore \frac{\mathrm{d} Q}{\mathrm{~d} t}=-k Q$, where $k$ is the positive constant of proportion.

## Differentiation

Exercise E, Question 5

## Question:

The ice on a pond has a thickness $x \mathrm{~mm}$ at a time $t$ hours after the start of freezing. The rate of increase of $x$ is inversely proportional to the square of $x$. Write down a differential equation in terms of $x$ and $t$.

## Solution:

The rate of increase of $x$ is $\frac{\mathrm{d} x}{\mathrm{~d} t}$.
$\therefore \frac{\mathrm{d} x}{\mathrm{~d} t} \propto \frac{1}{x^{2}}$, as there is an inverse proportion.
$\therefore \frac{\mathrm{d} x}{\mathrm{~d} t}=\frac{k}{x^{2}}$, where $k$ is the constant of proportion.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise E, Question 6

## Question:

In another pond the amount of pondweed $(P)$ grows at a rate proportional to the amount of pondweed already present in the pond. Pondweed is also removed by fish eating it at a constant rate of $Q$ per unit of time.
Write down a differential equation relating $P$ and $t$, where $t$ is the time which has elapsed since the start of the observation.

## Solution:

The rate of increase of pondweed is $\frac{\mathrm{d} P}{\mathrm{~d} t}$.
This is proportional to $P$.
$\therefore \frac{\mathrm{d} P}{\mathrm{~d} t} \propto P$
$\therefore \frac{\mathrm{d} P}{\mathrm{~d} t}=k P$, where $k$ is a constant.
But also pondweed is removed at a rate $Q$

$$
\therefore \frac{\mathrm{d} P}{\mathrm{~d} t}=k P-Q
$$

## Differentiation

Exercise E, Question 7

## Question:

A circular patch of oil on the surface of some water has radius $r$ and the radius increases over time at a rate inversely proportional to the radius.
Write down a differential equation relating $r$ and $t$, where $t$ is the time which has elapsed since the start of the observation.

## Solution:

The rate of increase of the radius is $\frac{\mathrm{d} r}{\mathrm{~d} t}$.
$\therefore \frac{\mathrm{d} r}{\mathrm{~d} t} \propto \frac{1}{r}$, as it is inversely proportional to the radius.
$\therefore \frac{\mathrm{d} r}{\mathrm{~d} t}=\frac{k}{r}$, where $k$ is the constant of proportion.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise E, Question 8

## Question:

A metal bar is heated to a certain temperature, then allowed to cool down and it is noted that, at time $t$, the rate of loss of temperature is proportional to the difference in temperature between the metal bar, $\theta$, and the temperature of its surroundings $\theta_{0}$.
Write down a differential equation relating $\theta$ and $t$.

## Solution:

The rate of change of temperature is $\frac{\mathrm{d} \theta}{\mathrm{d} t}$.
$\therefore \frac{\mathrm{d} \theta}{\mathrm{d} t} \propto-\left(\theta-\theta_{0}\right)$ The rate of loss indicates the negative sign.
$\therefore \frac{\mathrm{d} \theta}{\mathrm{d} t}=-k\left(\theta-\theta_{0}\right)$, where $k$ is the positive constant of proportion.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise E, Question 9

## Question:

Fluid flows out of a cylindrical tank with constant cross section. At time $t$ minutes, $t>0$, the volume of fluid remaining in the tank is $V \mathrm{~m}^{3}$. The rate at which the fluid flows in $\mathrm{m}^{3} \mathrm{~min}^{-1}$ is proportional to the square root of $V$. Show that the depth $h$ metres of fluid in the tank satisfies the differential equation $\frac{\mathrm{d} h}{\mathrm{~d} t}=-k \sqrt{ } h$, where $k$ is a positive constant.

## Solution:

Let the rate of flow of fluid be $\frac{-\mathrm{d} V}{\mathrm{~d} t}$, as fluid is flowing out of the tank, and the volume left in the tank is decreasing.

$$
\therefore \frac{-\mathrm{d} V}{\mathrm{~d} t} \propto V V
$$

$\therefore \frac{\mathrm{d} V}{\mathrm{~d} t}=-k^{\prime} \sqrt{ } V$, where $k^{\prime}$ is a positive constant.
But $V=A h$, where $A$ is the constant cross section.

$$
\therefore \frac{\mathrm{d} V}{\mathrm{~d} h}=A
$$

Use the chain rule to find $\frac{\mathrm{d} h}{\mathrm{~d} t}$ :

$$
\begin{aligned}
& \frac{\mathrm{d} V}{\mathrm{~d} t}=\frac{\mathrm{d} V}{\mathrm{~d} h} \times \frac{\mathrm{d} h}{\mathrm{~d} t} \\
& \therefore \frac{\mathrm{~d} h}{\mathrm{~d} t}=\frac{\mathrm{d} V}{\mathrm{~d} t} \div \frac{\mathrm{d} V}{\mathrm{~d} h}=\frac{-k^{\prime} V V}{A}
\end{aligned}
$$

But $V=A h$,
$\therefore \frac{\mathrm{d} h}{\mathrm{~d} t}=\frac{-k \sqrt{A h}}{A}=\left(\frac{-k^{\prime}}{\sqrt{ } A}\right) \sqrt{ } h=-k \sqrt{ } h$, where $\frac{k^{\prime}}{\sqrt{A}}$ is a positive constant.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise E, Question 10

## Question:

At time $t$ seconds the surface area of a cube is $A \quad \mathrm{~cm}^{2}$ and the volume is $V \mathrm{~cm}^{3}$.
The surface area of the cube is expanding at a constant rate $2 \mathrm{~cm}^{2} \mathrm{~s}^{-1}$.
Show that $\frac{\mathrm{d} V}{\mathrm{~d} t}=\frac{1}{2} V^{\frac{1}{3}}$.

## Solution:

Rate of expansion of surface area is $\frac{\mathrm{d} A}{\mathrm{~d} t}$.
Need $\frac{\mathrm{d} V}{\mathrm{~d} t}$ so use the chain rule.
$\frac{\mathrm{d} V}{\mathrm{~d} t}=\frac{\mathrm{d} V}{\mathrm{~d} A} \times \frac{\mathrm{d} A}{\mathrm{~d} t}$
As $\frac{\mathrm{d} A}{\mathrm{~d} t}=2, \frac{\mathrm{~d} V}{\mathrm{~d} t}=2 \frac{\mathrm{~d} V}{\mathrm{~d} A}$ or $2 \div\left(\frac{\mathrm{d} A}{\mathrm{~d} V}\right)$
Let the cube have edge of length $x \mathrm{~cm}$.
Then $V=x^{3}$ and $A=6 x^{2}$.
Eliminate $x$ to give $A=6 V^{\frac{2}{3}}$

$$
\therefore \frac{\mathrm{d} A}{\mathrm{~d} V}=4 V^{\frac{-1}{3}}
$$

From (1) $\quad \frac{\mathrm{d} V}{\mathrm{~d} t}=\frac{2}{4 V^{-\frac{1}{3}}}=\frac{2 V^{\frac{1}{3}}}{4}=\frac{1}{2} V^{\frac{1}{3}}$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise E, Question 11

## Question:

An inverted conical funnel is full of salt. The salt is allowed to leave by a small hole in the vertex. It leaves at a constant rate of $6 \mathrm{~cm}^{3} \mathrm{~s}^{-1}$.
Given that the angle of the cone between the slanting edge and the vertical is 30 degrees, show that the volume of the salt is $\frac{1}{9} \pi h^{3}$, where $h$ is the height of salt at time $t$ seconds.
Show that the rate of change of the height of the salt in the funnel is inversely proportional to $h^{2}$. Write down the differential equation relating $h$ and $t$.

## Solution:

Use $V=\frac{1}{3} \pi r^{2} h$
As $\tan 30^{\circ}=\frac{r}{h}$
$\therefore r=h \tan 30^{\circ}=\frac{h}{\sqrt{3}}$
$\therefore V=\frac{1}{3} \pi\left(\frac{h^{2}}{3}\right) \times h=\frac{1}{9} \pi h^{3}$
It is given that $\frac{\mathrm{d} V}{\mathrm{~d} t}=-6$.
To find $\frac{\mathrm{d} h}{\mathrm{~d} t}$ use the chain rule:

$$
\frac{\mathrm{d} h}{\mathrm{~d} t}=\frac{\mathrm{d} V}{\mathrm{~d} t} \times \frac{\mathrm{d} h}{\mathrm{~d} V}=\frac{\mathrm{d} V}{\mathrm{~d} t} \div \frac{\mathrm{d} V}{\mathrm{~d} h}
$$

From (1) $\frac{\mathrm{d} V}{\mathrm{~d} h}=\frac{1}{3} \pi h^{2}$
$\therefore \frac{\mathrm{d} h}{\mathrm{~d} t}=-6 \div \frac{1}{3} \pi h^{2}$
$\therefore \frac{\mathrm{d} h}{\mathrm{~d} t}=\frac{-18}{\pi h^{2}}$

## Differentiation

Exercise F, Question 1

## Question:

The curve $C$ is given by the equations
$x=4 t-3, y=\frac{8}{t^{2}}, t>0$
where $t$ is a parameter.
At $A, t=2$. The line $l$ is the normal to $C$ at $A$.
(a) Find $\frac{d y}{d x}$ in terms of $t$.
(b) Hence find an equation of $l$. $\boldsymbol{E}$

## Solution:

(a) $x=4 t-3, y=\frac{8}{t^{2}}=8 t^{-2}$

$$
\therefore \frac{\mathrm{d} x}{\mathrm{~d} t}=4 \text { and } \frac{\mathrm{d} y}{\mathrm{~d} t}=-16 t^{-3}
$$

$$
\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{-16 t^{-3}}{4}=\frac{-4}{t^{3}}
$$

(b) When $t=2$ the curve has gradient $\frac{-4}{8}=-\frac{1}{2}$.
$\therefore$ the normal has gradient 2 .
Also the point $A$ has coordinates $(5,2)$
$\therefore$ the equation of the normal is

$$
\begin{aligned}
& y-2=2(x-5) \\
& \text { i.e. } y=2 x-8
\end{aligned}
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 2

## Question:

The curve $C$ is given by the equations $x=2 t, y=t^{2}$, where $t$ is a parameter. Find an equation of the normal to $C$ at the point $P$ on $C$ where $t=3$. .

## Solution:

$x=2 t, y=t^{2}$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=2, \frac{\mathrm{~d} y}{\mathrm{~d} t}=2 t$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2 t}{2}=t$
When $t=3$ the gradient of the curve is 3 .
$\therefore$ the gradient of the normal is $-\frac{1}{3}$.
Also at the point $P$ where $t=3$, the coordinates are $(6,9)$.
$\therefore$ the equation of the normal is

$$
\begin{aligned}
& y-9=-\frac{1}{3}(x-6) \\
& \text { i.e. } 3 y-27=-x+6 \\
& \therefore 3 y+x=33
\end{aligned}
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 3

## Question:

The curve $C$ has parametric equations
$x=t^{3}, y=t^{2}, t>0$
Find an equation of the tangent to $C$ at $A(1,1)$. $\boldsymbol{E}$

## Solution:

$x=t^{3}, y=t^{2}$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=3 t^{2}$ and $\frac{\mathrm{d} y}{\mathrm{~d} t}=2 t$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2 t}{3 t^{2}}=\frac{2}{3 t}$
At the point $(1,1)$ the value of $t$ is 1 .
$\therefore$ the gradient of the curve is $\frac{2}{3}$, which is also the gradient of the tangent.
$\therefore$ the equation of the tangent is
$y-1=\frac{2}{3}(x-1)$
i.e. $y=\frac{2}{3} x+\frac{1}{3}$
© Pearson Education Ltd 2009

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 4

## Question:

A curve $C$ is given by the equations
$x=2 \cos t+\sin 2 t, y=\cos t-2 \sin 2 t, 0<t<\pi$ where $t$ is a parameter.
(a) Find $\frac{\mathrm{d} x}{\mathrm{~d} t}$ and $\frac{\mathrm{d} y}{\mathrm{~d} t}$ in terms of $t$.
(b) Find the value of $\frac{\mathrm{d} y}{\mathrm{~d} x}$ at the point $P$ on $C$ where $t=\frac{\pi}{4}$.
(c) Find an equation of the normal to the curve at $P$. $\boldsymbol{E}$

## Solution:

(a) $x=2 \cos t+\sin 2 t, y=\cos t-2 \sin 2 t$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=-2 \sin t+2 \cos 2 t, \frac{\mathrm{~d} y}{\mathrm{~d} t}=-\sin t-4 \cos 2 t$
(b) $\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{-\sin t-4 \cos 2 t}{-2 \sin t+2 \cos 2 t}$

When $t=\frac{\pi}{4}, \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{\frac{-1}{\sqrt{2}-0}}{\frac{-2}{\sqrt{2}}+0}=\frac{1}{2}$
(c) $\therefore$ the gradient of the normal at the point $P$, where $t=\frac{\pi}{4}$, is -2 .

The coordinates of $P$ are found by substituting $t=\frac{\pi}{4}$ into the parametric equations, to give

$$
x=\frac{2}{\sqrt{ } 2}+1, y=\frac{1}{\sqrt{ } 2}-2
$$

$\therefore$ the equation of the normal is

$$
y-\left(\frac{1}{\sqrt{2}}-2\right)=-2\left[x-\left(\frac{2}{\sqrt{2}}+1\right)\right]
$$

$$
\begin{aligned}
& \text { i.e. } y-\frac{1}{\sqrt{ } 2}+2=-2 x+\frac{4}{\sqrt{ } 2}+2 \\
& \therefore y+2 x=\frac{5 \sqrt{ } 2}{2}
\end{aligned}
$$

© Pearson Education Ltd 2009

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 5

## Question:

A curve is given by $x=2 t+3, y=t^{3}-4 t$, where $t$ is a parameter. The point $A$ has parameter $t=-1$ and the line $l$ is the tangent to $C$ at $A$. The line $l$ also cuts the curve at $B$.
(a) Show that an equation for $l$ is $2 y+x=7$.
(b) Find the value of $t$ at $B$. (

## Solution:

(a) $x=2 t+3, y=t^{3}-4 t$

At point $A, t=-1$.
$\therefore$ the coordinates of the point $A$ are $(1,3)$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=2$ and $\frac{\mathrm{d} y}{\mathrm{~d} t}=3 t^{2}-4$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{3 t^{2}-4}{2}$
At the point $A, \frac{\mathrm{~d} y}{\mathrm{~d} x}=-\frac{1}{2}$
$\therefore$ the gradient of the tangent at $A$ is $-\frac{1}{2}$.
$\therefore$ the equation of the tangent at $A$ is
$y-3=-\frac{1}{2}(x-1)$
i.e. $2 y-6=-x+1$
$\therefore 2 y+x=7$
(b) This line cuts the curve at the point $B$.
$\therefore 2\left(t^{3}-4 t\right)+(2 t+3)=7$ gives the values of $t$ at $A$ and $B$.
i.e. $2 t^{3}-6 t-4=0$

At $A, t=-1$
$\therefore(t+1)$ is a root of this equation

$$
\begin{aligned}
& 2 t^{3}-6 t-4=(t+1)\left(2 t^{2}-2 t-4\right)=(t+1)(t+1) \\
& 2 t-4)=2(t+1)^{2}(t-2)
\end{aligned}
$$

So when the line meets the curve, $t=-1$ (repeated root because the line touches the curve) or $t=2$.
$\therefore$ at the point $B, t=2$.
© Pearson Education Ltd 2009

## Differentiation

Exercise F, Question 6

## Question:

A Pancho car has value $£ V$ at time $t$ years. A model for $V$ assumes that the rate of decrease of $V$ at time $t$ is proportional to $V$. Form an appropriate differential equation for $V$. $\boldsymbol{E}$

## Solution:

$\frac{\mathrm{d} V}{\mathrm{~d} t}$ is the rate of change of $V$.
$\frac{\mathrm{d} V}{\mathrm{~d} t} \propto-V$, as a decrease indicates a negative quantity.
$\therefore \frac{\mathrm{d} V}{\mathrm{~d} t}=-k V$, where $k$ is a positive constant of proportionality.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 7

## Question:

The curve shown has parametric equations
$x=5 \cos \theta, y=4 \sin \theta, 0 \leq \theta<2 \pi$

(a) Find the gradient of the curve at the point $P$ at which $\theta=\frac{\pi}{4}$.
(b) Find an equation of the tangent to the curve at the point $P$.
(c) Find the coordinates of the point $R$ where this tangent meets the $x$-axis. $\boldsymbol{E}$

## Solution:

(a) $x=5 \cos \theta, y=4 \sin \theta$

$$
\frac{\mathrm{d} x}{\mathrm{~d} \theta}=-5 \sin \theta \text { and } \frac{\mathrm{d} y}{\mathrm{~d} \theta}=4 \cos \theta
$$

$$
\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{-4 \cos \theta}{5 \sin \theta}
$$

At the point $P$, where $\theta=\frac{\pi}{4}, \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{-4}{5}$.
(b) At the point $P, x=\frac{5}{\sqrt{2}}$ and $y=\frac{4}{\sqrt{2}}$.
$\therefore$ the equation of the tangent at $P$ is

$$
\begin{aligned}
& y-\frac{4}{\sqrt{ } 2}=\frac{-4}{5}\left(x-\frac{5}{\sqrt{ } 2}\right) \\
& \text { i.e. } y-\frac{4}{\sqrt{ } 2}=\frac{-4}{5} x+\frac{4}{\sqrt{2}}
\end{aligned}
$$

$\therefore y=\frac{-4}{5} x+\frac{8}{\sqrt{2}}$
Multiply equation by 5 and rationalise the denominator of the surd: $5 y+4 x=20 \sqrt{ } 2$
(c) The tangent meets the $x$-axis when $y=0$.

$$
\therefore x=5 \sqrt{ } 2 \text { and } R \text { has coordinates }(5 \sqrt{ } 2,0) .
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 8

## Question:

The curve $C$ has parametric equations
$x=4 \cos 2 t, y=3 \sin t,-\frac{\pi}{2}<t<\frac{\pi}{2}$
$A$ is the point $\left(2,1 \frac{1}{2}\right)$, and lies on $C$.
(a) Find the value of $t$ at the point $A$.
(b) Find $\frac{d y}{d x}$ in terms of $t$.
(c) Show that an equation of the normal to $C$ at $A$ is $6 y-16 x+23=0$.

The normal at $A$ cuts $C$ again at the point $B$.
(d) Find the $y$-coordinate of the point $B$.

## E

## Solution:

(a) $x=4 \cos 2 t$ and $y=3 \sin t$
$A$ is the point $\left(2,1 \frac{1}{2}\right)$ and so
$4 \cos 2 t=2$ and $3 \sin t=1 \frac{1}{2}$
$\therefore \cos 2 t=\frac{1}{2}$ and $\sin t=\frac{1}{2}$
As $-\frac{\pi}{2}<t<\frac{\pi}{2}, t=\frac{\pi}{6}$ at the point $A$.
(b) $\frac{\mathrm{d} x}{\mathrm{~d} t}=-8 \sin 2 t$ and $\frac{\mathrm{d} y}{\mathrm{~d} t}=3 \cos t$

$$
\begin{aligned}
\therefore \frac{\mathrm{d} y}{\mathrm{~d} x} & =\frac{3 \cos t}{-8 \sin 2 t} \\
& =\frac{-3 \cos t}{16 \sin t \cos t} \quad \text { (using the double angle formula) }
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{-3}{16 \sin t} \\
& =\frac{-3}{16} \operatorname{cosec} t
\end{aligned}
$$

(c) When $t=\frac{\pi}{6}, \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{-3}{8}$
$\therefore$ the gradient of the normal at the point $A$ is $\frac{8}{3}$.
$\therefore$ the equation of the normal is
$y-1 \frac{1}{2}=\frac{8}{3}(x-2)$
Multiply equation by 6 :
$6 y-9=16 x-32$
$\therefore 6 y-16 x+23=0$
(d) The normal cuts the curve when
$6(3 \sin t)-16(4 \cos 2 t)+23=0$
$\therefore 18 \sin t-64 \cos 2 t+23=0$.
$\therefore 18 \sin t-64\left(1-2 \sin ^{2} t\right)+23=0 \quad$ (using the double angle
formula)
$\therefore 128 \sin ^{2} t+18 \sin t-41=0$
But $\sin t=\frac{1}{2}$ is one solution of this equation, as point $A$ lies on the line and on the curve.
$\therefore 128 \sin ^{2} t+18 \sin t-41=(2 \sin t-1)(64 \sin t+41)$
$\therefore(2 \sin t-1)(64 \sin t+41)=0$
$\therefore$ at point $B, \sin t=\frac{-41}{64}$
$\therefore$ the $y$ coordinate of point $B$ is $\frac{-123}{64}$.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 9

## Question:

The diagram shows the curve $C$ with parametric equations
$x=a \sin ^{2} t, y=a \cos t, 0 \leq t \leq \frac{1}{2} \pi$
where $a$ is a positive constant. The point $P$ lies on $C$ and has coordinates $\left.\frac{3}{4} a, \quad \frac{1}{2} a\right)$.

(a) Find $\frac{\mathrm{d} y}{\mathrm{~d} x}$, giving your answer in terms of $t$.
(b) Find an equation of the tangent at $P$ to $C$.

## E

## Solution:

(a) $x=a \sin ^{2} t, y=a \cos t$

$$
\begin{aligned}
& \frac{\mathrm{d} x}{\mathrm{~d} t}=2 a \sin t \cos t \text { and } \frac{\mathrm{d} y}{\mathrm{~d} t}=-a \sin t \\
& \therefore \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{-a \sin t}{2 a \sin t \cos t}=\frac{-1}{2 \cos t}=\frac{-1}{2} \sec t
\end{aligned}
$$

(b) $P$ is the point $\left(\frac{3}{4} a, \frac{1}{2} a\right)$ and lies on the curve.

$$
\begin{aligned}
& \therefore a \sin ^{2} t=\frac{3}{4} a \text { and } a \cos t=\frac{1}{2} a \\
& \therefore \sin t= \pm \frac{\sqrt{ } 3}{2} \text { and } \cos t=\frac{1}{2} \text { and } 0 \leq t \leq \frac{1}{2} \pi \\
& \therefore t=\frac{\pi}{3}
\end{aligned}
$$

$\therefore$ the gradient of the curve at point $P$ is $-\frac{1}{2} \sec \frac{\pi}{3}=-1$.
The equation of the tangent at $P$ is

$$
\begin{aligned}
& y-\frac{1}{2} a=-1\left(x-\frac{3}{4} a\right) \\
& \therefore y+x=\frac{1}{2} a+\frac{3}{4} a
\end{aligned}
$$

Multiply equation by 4 to give $4 y+4 x=5 a$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 10

## Question:

This graph shows part of the curve $C$ with parametric equations
$x=(t+1)^{2}, y=\frac{1}{2} t^{3}+3, t \geq-1$
$P$ is the point on the curve where $t=2$. The line $l$ is the normal to $C$ at $P$.
Find the equation of $l$.

## E

## Solution:

$x=(t+1)^{2}, y=\frac{1}{2} t^{3}+3$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=2(t+1)$ and $\frac{\mathrm{d} y}{\mathrm{~d} t}=\frac{3}{2} t^{2}$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{\left(\frac{3}{2} t^{2}\right)}{2(t+1)}=\frac{3 t^{2}}{4(t+1)}$

When $t=2, \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{3 \times 4}{4 \times 3}=1$
The gradient of the normal at the point $P$ where $t=2$, is -1 .
The coordinates of $P$ are $(9,7)$.
$\therefore$ the equation of the normal is
$y-7=-1(x-9)$
i.e. $y-7=-x+9$

## Differentiation

Exercise F, Question 11

## Question:

The diagram shows part of the curve $C$ with parametric equations
$x=t^{2}, y=\sin 2 t, t \geq 0$
The point $A$ is an intersection of $C$ with the $x$-axis.

(a) Find, in terms of $\pi$, the $x$-coordinate of $A$.
(b) Find $\frac{\mathrm{d} y}{\mathrm{~d} x}$ in terms of $t, t>0$.
(c) Show that an equation of the tangent to $C$ at $A$ is $4 x+2 \pi y=\pi^{2}$.

## E

## Solution:

(a) $x=t^{2}$ and $y=\sin 2 t$

At the point $A, y=0$.
$\therefore \sin 2 t=0$
$\therefore 2 t=\pi$
$\therefore t=\frac{\pi}{2}$
The point $A$ is $\left(\frac{\pi^{2}}{4}, 0\right)$
(b) $\frac{\mathrm{d} x}{\mathrm{~d} t}=2 t$ and $\frac{\mathrm{d} y}{\mathrm{~d} t}=2 \cos 2 t$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{\cos 2 t}{t}$
(c) At point $A, \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{-1}{\left(\frac{\pi}{2}\right)}=\frac{-2}{\pi}$

$$
\left(\frac{\pi}{2}\right)
$$

$\therefore$ the gradient of the tangent at $A$ is $\frac{-2}{\pi}$.
$\therefore$ the equation of the tangent at $A$ is

$$
\begin{aligned}
& y-0=\frac{-2}{\pi}\left(x-\frac{\pi^{2}}{4}\right) \\
& \text { i.e. } y=\frac{-2 x}{\pi}+\frac{\pi}{2}
\end{aligned}
$$

Multiply equation by $2 \pi$ to give

$$
2 \pi y+4 x=\pi^{2}
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 12

## Question:

Find the gradient of the curve with equation
$5 x^{2}+5 y^{2}-6 x y=13$
at the point $(1,2)$.

## E

## Solution:

$5 x^{2}+5 y^{2}-6 x y=13$
Differentiate implicitly with respect to $x$ :
$10 x+10 y \frac{\mathrm{~d} y}{\mathrm{~d} x}-\left(6 x \frac{\mathrm{~d} y}{\mathrm{~d} x}+6 y\right)=0$
$\therefore \frac{d y}{d x}(10 y-6 x)+10 x-6 y=0$
At the point $(1,2)$
$\frac{\mathrm{d} y}{\mathrm{~d} x}(14)+10-12=0$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2}{14}=\frac{1}{7}$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 13

## Question:

Given that $\mathrm{e}^{2 x}+\mathrm{e}^{2 y}=x y$, find $\frac{\mathrm{d} y}{\mathrm{~d} x}$ in terms of $x$ and $y$.

## E

## Solution:

$\mathrm{e}^{2 x}+\mathrm{e}^{2 y}=x y$
Differentiate with respect to $x$ :
$2 \mathrm{e}^{2 x}+2 \mathrm{e}^{2 y} \frac{\mathrm{~d} y}{\mathrm{~d} x}=x \frac{\mathrm{~d} y}{\mathrm{~d} x}+y \times 1$
$\therefore 2 \mathrm{e}^{2 y} \frac{\mathrm{~d} y}{\mathrm{~d} x}-x \frac{\mathrm{~d} y}{\mathrm{~d} x}=y-2 \mathrm{e}^{2 x}$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}\left(2 \mathrm{e}^{2 y}-x\right)=y-2 \mathrm{e}^{2 x}$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{y-2 \mathrm{e}^{2 x}}{2 \mathrm{e}^{2 y}-x}$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 14

## Question:

Find the coordinates of the turning points on the curve $y^{3}+3 x y^{2}-x^{3}=3$.

## E

## Solution:

$$
y^{3}+3 x y^{2}-x^{3}=3
$$

Differentiate with respect to $x$ :

$$
\begin{aligned}
& 3 y^{2} \frac{\mathrm{~d} y}{\mathrm{~d} x}+\left(3 x \times 2 y \frac{\mathrm{~d} y}{\mathrm{~d} x}+y^{2} \times 3\right)-3 x^{2}=0 \\
& \therefore \frac{\mathrm{~d} y}{\mathrm{~d} x}\left(3 y^{2}+6 x y\right)=3 x^{2}-3 y^{2} \\
& \therefore \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{3\left(x^{2}-y^{2}\right)}{3 y(y+2 x)}=\frac{x^{2}-y^{2}}{y(y+2 x)}
\end{aligned}
$$

When $\frac{\mathrm{d} y}{\mathrm{~d} x}=0, x^{2}=y^{2}$, i.e. $x= \pm y$
When $x=+y, y^{3}+3 y^{3}-y^{3}=3 \quad \Rightarrow \quad 3 y^{3}=3 \quad \Rightarrow \quad y=1$ and $x=1$
When $x=-y, y^{3}-3 y^{3}+y^{3}=3 \quad \Rightarrow \quad-y^{3}=3 \quad \Rightarrow \quad y=\sqrt[3]{(-3)}$ and $x=-\sqrt[3]{(-3)}$
$\therefore$ the coordinates are $(1,1)$ and $(-\sqrt[3]{(-3)}, \sqrt[3]{(-3)})$.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 15

## Question:

Given that $y(x+y)=3$, evaluate $\frac{\mathrm{d} y}{\mathrm{~d} x}$ when $y=1$.

## E

## Solution:

$y(x+y)=3$
$\therefore y x+y^{2}=3$
Differentiate with respect to $x$ :
$\left(y+x \frac{\mathrm{~d} y}{\mathrm{~d} x}\right)+2 y \frac{\mathrm{~d} y}{\mathrm{~d} x}=0$
When $y=1,1(x+1)=3 \quad$ (from original equation)
$\therefore x=2$
Substitute into (1):
$1+2 \frac{\mathrm{~d} y}{\mathrm{~d} x}+2 \frac{\mathrm{~d} y}{\mathrm{~d} x}=0$
$\therefore 4 \frac{\mathrm{~d} y}{\mathrm{~d} x}=-1$
i.e. $\frac{d y}{d x}=\frac{-1}{4}$
© Pearson Education Ltd 2009

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 16

## Question:

(a) If $(1+x)(2+y)=x^{2}+y^{2}$, find $\frac{\mathrm{d} y}{\mathrm{~d} x}$ in terms of $x$ and $y$.
(b) Find the gradient of the curve $(1+x)(2+y)=x^{2}+y^{2}$ at each of the two points where the curve meets the $y$-axis.
(c) Show also that there are two points at which the tangents to this curve are parallel to the $y$-axis.

## E

## Solution:

(a) $(1+x)(2+y)=x^{2}+y^{2}$

Differentiate with respect to $x$ :

$$
\begin{aligned}
& (1+x)\left(\frac{\mathrm{d} y}{\mathrm{~d} x}\right)+(2+y)(1)=2 x+2 y \frac{\mathrm{~d} y}{\mathrm{~d} x} \\
& \therefore(1+x-2 y) \frac{\mathrm{d} y}{\mathrm{~d} x}=2 x-y-2 \\
& \therefore \frac{\mathrm{~d} y}{\mathrm{~d} x}=\frac{2 x-y-2}{1+x-2 y}
\end{aligned}
$$

(b) When the curve meets the $y$-axis, $x=0$.

Put $x=0$ in original equation $(1+x)(2+y)=x^{2}+y^{2}$.
Then $2+y=y^{2}$
i.e. $y^{2}-y-2=0$
$\Rightarrow \quad(y-2)(y+1)=0$
$\therefore y=2$ or $y=-1$ when $x=0$
At $(0,2), \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{-4}{-3}=\frac{4}{3}$
At $(0,-1), \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{-1}{3}$
(c) When the tangent is parallel to the $y$-axis it has infinite gradient and as

$$
\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2 x-y-2}{1+x-2 y}
$$

So $1+x-2 y=0$
Substitute $1+x=2 y$ into the equation of the curve:
$2 y(2+y)=(2 y-1)^{2}+y^{2}$
$2 y^{2}+4 y=4 y^{2}-4 y+1+y^{2}$
$3 y^{2}-8 y+1=0$
$y=\frac{8 \pm \sqrt{64-12}}{6}=\frac{4 \pm \sqrt{13}}{3}$
When $y=\frac{4+\sqrt{13}}{3}, x=\frac{5+2 \sqrt{13}}{3}$
When $y=\frac{4-\sqrt{13}}{3}, x=\frac{5-2 \sqrt{13}}{3}$
$\therefore$ there are two points at which the tangents are parallel to the $y$-axis.
They are $\left(\frac{5+2 \sqrt{13}}{3}, \frac{4+\sqrt{13}}{3}\right)$ and $\left(\frac{5-2 \sqrt{13}}{3}, \frac{4-\sqrt{13}}{3}\right)$.

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 17

## Question:

A curve has equation $7 x^{2}+48 x y-7 y^{2}+75=0 . A$ and $B$ are two distinct points on the curve and at each of these points the gradient of the curve is equal to $\frac{2}{11}$.
Use implicit differentiation to show that $x+2 y=0$ at the points $A$ and $B$.

## E

## Solution:

$7 x^{2}+48 x y-7 y^{2}+75=0$
Differentiate with respect to $x$ (implicit differentiation):
$14 x+\left(48 x \frac{\mathrm{~d} y}{\mathrm{~d} x}+48 y\right)-14 y \frac{\mathrm{~d} y}{\mathrm{~d} x}=0$
Given that $\frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{2}{11}$

$$
\therefore 14 x+48 x \times \frac{2}{11}+48 y-14 y \times \frac{2}{11}=0
$$

Multiply equation by 11 , then $154 x+96 x+528 y-28 y=0$
$\therefore 250 x+500 y=0$
i.e. $x+2 y=0$, after division by 250 .
© Pearson Education Ltd 2009

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 18

## Question:

Given that $y=x^{x}, x>0, y>0$, by taking logarithms show that $\frac{\mathrm{d} y}{\mathrm{~d} x}=x^{x}(1+\ln x)$

## E

## Solution:

$y=x^{x}$
Take natural logs of both sides:
$\ln y=\ln x^{x}$
$\therefore \ln y=x \ln x \quad$ Property of $\ln s$
Differentiate with respect to $x$ :
$\frac{1}{y} \frac{\mathrm{~d} y}{\mathrm{~d} x}=x \times \frac{1}{x}+\ln x \times 1$
$\frac{1}{y} \frac{\mathrm{~d} y}{\mathrm{~d} x}=1+\ln x$

$$
\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=y(1+\ln x)
$$

But $y=x^{x}$

$$
\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=x^{x}(1+\ln x)
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 19

## Question:

(a) Given that $x=2^{t}$, by using logarithms prove that
$\frac{\mathrm{d} x}{\mathrm{~d} t}=2^{t} \ln 2$
A curve $C$ has parametric equations $x=2^{t}, y=3 t^{2}$. The tangent to $C$ at the point with coordinates $(2,3)$ cuts the $x$-axis at the point $P$.
(b) Find $\frac{d y}{d x}$ in terms of $t$.
(c) Calculate the $x$-coordinate of $P$, giving your answer to 3 decimal places.

## E

## Solution:

(a) Given $x=2^{t}$

Take natural logs of both sides:
$\ln x=\ln 2^{t}=t \ln 2$
Differentiate with respect to $t$ :
$\frac{1}{x} \frac{\mathrm{~d} x}{\mathrm{~d} t}=\ln 2$
$\therefore \frac{\mathrm{d} x}{\mathrm{~d} t}=x \ln 2=2^{t} \ln 2$
(b) $x=2^{t}, y=3 t^{2}$
$\frac{\mathrm{d} x}{\mathrm{~d} t}=2^{t} \ln 2, \frac{\mathrm{~d} y}{\mathrm{~d} t}=6 t$
$\therefore \frac{\mathrm{d} y}{\mathrm{~d} x}=\frac{6 t}{2^{t} \ln 2}$
(c) At the point $(2,3), t=1$.

The gradient of the curve at $(2,3)$ is $\frac{6}{2 \ln 2}$.
$\therefore$ the equation of the tangent is

$$
\begin{aligned}
& y-3=\frac{6}{2 \ln 2}(x-2) \\
& \text { i.e. } y=\frac{3}{\ln 2} x-\frac{6}{\ln 2}+3
\end{aligned}
$$

The tangent meets the $x$-axis when $y=0$.
$\therefore \frac{3}{\ln 2} x=\frac{6}{\ln 2}-3$
$\therefore x=2-\ln 2=1.307$ ( 3 decimal places)
© Pearson Education Ltd 2009

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 20

## Question:

(a) Given that $a^{x} \equiv \mathrm{e}^{k x}$, where $a$ and $k$ are constants, $a>0$ and $x \in \mathbb{R}$, prove that $k=\ln a$.
(b) Hence, using the derivative of $\mathrm{e}^{k x}$, prove that when $y=2^{x}$ $\frac{\mathrm{d} y}{\mathrm{~d} x}=2^{x} \ln 2$.
(c) Hence deduce that the gradient of the curve with equation $y=2^{x}$ at the point $(2,4)$ is $\ln 16$.

## E

## Solution:

(a) $a^{x}=\mathrm{e}^{k x}$

Take lns of both sides:
$\ln a^{x}=\ln \mathrm{e}^{k x}$
i.e. $x \ln a=k x$

As this is true for all values of $x, k=\ln a$.
(b) Therefore, $2^{x}=\mathrm{e}^{\ln 2 \times x}$

When $y=2^{x}=\mathrm{e}^{\ln 2 \times x}$
$\frac{\mathrm{d} y}{\mathrm{~d} x}=\ln 2 \mathrm{e}^{\ln 2 \times x}=\ln 2 \times 2^{x}$
(c) At the point (2, 4), $x=2$.
$\therefore$ the gradient of the curve is

$$
\begin{aligned}
& 2^{2} \ln 2 \\
& =4 \ln 2 \\
& =\ln 2^{4} \quad(\text { property of } \operatorname{logs}) \\
& =\ln 16
\end{aligned}
$$

## Solutionbank <br> Edexcel AS and A Level Modular Mathematics

## Differentiation

Exercise F, Question 21

## Question:

A population $P$ is growing at the rate of $9 \%$ each year and at time $t$ years may be approximated by the formula
$P=P_{0}(1.09)^{t}, t \geq 0$
where $P$ is regarded as a continuous function of $t$ and $P_{0}$ is the starting population at time $t=0$.
(a) Find an expression for $t$ in terms of $P$ and $P_{0}$.
(b) Find the time $T$ years when the population has doubled from its value at $t=0$, giving your answer to 3 significant figures.
(c) Find, as a multiple of $P_{0}$, the rate of change of population $\frac{\mathrm{d} P}{\mathrm{~d} t}$ at time $t=T$. $\boldsymbol{E}$

## Solution:

(a) $P=P_{0}(1.09)^{t}$

Take natural logs of both sides:
$\ln P=\ln \left[P_{0}(1.09)^{t}\right]=\ln P_{0}+t \ln 1.09$
$\therefore t \ln 1.09=\ln P-\ln P_{0}$
$\Rightarrow \quad t=\frac{\ln P-\ln P_{0}}{\ln 1.09} \quad$ or $\quad \frac{\ln \left(\frac{P}{P_{0}}\right)}{\ln 1.09}$
(b) When $P=2 P_{0}, t=T$.
$\therefore T=\frac{\ln 2}{\ln 1.09}=8.04$ (to 3 significant figures)
(c) $\frac{\mathrm{d} P}{\mathrm{~d} t}=P_{0}(1.09)^{t} \ln 1.09$

When $t=T, P=2 P_{0}$ so $(1.09)^{T}=2$ and

$$
\begin{aligned}
\frac{\mathrm{d} P}{\mathrm{~d} t} & =P_{0} \times 2 \times \ln 1.09 \\
& =\ln \left(1.09^{2}\right) \times P_{0}=\ln (1.1881) \times P_{0} \\
& =0.172 P_{0} \text { (to } 3 \text { significant figures) }
\end{aligned}
$$
