

# 4736 Decision Mathematics 1

<b>1 (i)</b>	[43 172 536 17 314 462 220 231]  43 172 536 17 220 314 462 231	M1 M1 A1	First folder correct Second folder correct All correct (cao)	[3]
<b>(ii)</b>	536 462 314 231 220 172 43 17  536 462 314 231 220 172 43 17	B1  M1 A1	List sorted into decreasing order seen (cao)  [Follow through from a decreasing list with no more than 1 error or omission]  First folder correct All correct	[3]
<b>(iii)</b>	$(5000 \div 500)^2 \times 1.3$  = 130 seconds	M1  A1	$10^2 \times 1.3$ or any equivalent calculation Correct answer, with units	[2]
<b>Total = 8</b>				

<b>2 (i)</b>	The sum of the orders must be even, (but $1+2+3+3 = 9$ which is odd).	B1	There must be an even number of odd nodes.	[1]
<b>(ii) a</b>	eg 	M1  A1	A graph with five vertices that is neither connected nor simple  Vertex orders 1, 1, 2, 2, 4	[2]
<b>b</b>	Because it is not connected	B1	You cannot get from one part of the graph to the other part.	[1]
<b>c</b>	eg 	B1	A connected graph with vertex orders 1, 1, 2, 2, 4 (Need not be simple)	[1]
<b>(iii) a</b>	There are five arcs joined to A. Either Ann has met (at least) three of the others or she has met two or fewer, in which case there are at least three that she has not met. In the first case at least three of the arcs joined to A are blue, in the second case at least three of the arcs joined to A are red.	M1  A1	A reasonable attempt (for example, identifying that there are five arcs joined to A)  A convincing explanation (this could be a list of the possibilities or a well reasoned explanation)	[2]
<b>b</b>	If any two of Bob, Caz and Del have met one another then B, C and D form a blue triangle with A. Otherwise B, C and D form a red triangle.	M1  A1	A reasonable or partial attempt (using A with B, C, D) A convincing explanation (explaining both cases fully)	[2]
<b>Total = 9</b>				

<p><b>3</b> <b>(i)</b></p>	$y \geq x$ $x + y \leq 8$ $x \geq 1$	<p>M1 M1 M1 A1</p>	<p>Line <math>y = x</math> in any form                      Line <math>x + y = 8</math> in any form                      Line <math>x = 1</math> in any form                      All inequalities correct                      [Ignore extra inequalities that do not affect the feasible region]</p>	<p>[4]</p>
<p><b>(ii)</b></p>	<p>(1, 1), (1, 7), (4, 4)</p>	<p>M1 A1</p>	<p>Any two correct coordinates                      All three correct                      [Extra coordinates given <math>\Rightarrow</math> M1, A0]</p>	<p>[2]</p>
<p><b>(iii)</b></p>	<p>(1, 7) 23                      (4, 4) 20                      At optimum, <math>x = 1</math> and <math>y = 7</math>                      Maximum value = 23</p>	<p>M1  A1 A1</p>	<p>Follow through if possible                      Testing vertices or using a line of constant profit (may be implied)                      Accept (1, 7) identified                      23 identified</p>	<p>[3]</p>
