Pearson: helping people progress, everywhere

Pearson aspires to be the world's leading learning company. Our aim is to help everyone progress in their lives through education. We believe in every kind of learning, for all kinds of people, wherever they are in the world. We've been involved in education for over 150 years, and by working across 70 countries, in 100 languages, we have built an international reputation for our commitment to high standards and raising achievement through innovation in education. Find out more about how we can help you and your students at:

www.pearson.com/uk

General guidance to Topic Tests

Context

• Topic Tests have come from past papers both <u>published</u> (those materials available publicly) and unpublished (those currently under padlock to our centres) presented in a different format to allow teachers to adapt them for use with candidates.

Purpose

- The purpose of this resource is to provide qualification-specific sets/groups of questions covering the knowledge, skills and understanding relevant to this Pearson qualification.
- This document should be used in conjunction with the advance information for the subject as well as general marking guidance for the qualification (available in published mark schemes).

Revise Revision Guide content coverage

The questions in this topic test have been taken from past papers, and have been selected as they cover the topic(s) most closely aligned to the <u>A level</u> advance information for summer 2022:

- Topic 10: Vectors
 - Use vectors to solve a problem in pure mathematics

The focus of content in this topic test can be found in the Revise Pearson Edexcel A level Mathematics Revision Guide. Free access to this Revise Guide is available for front of class use, to support your students' revision.

Contents	Revise Guide	Level
	page reference	
Pure Mathematics	1-111	A level
Statistics	112-147	A level
Mechanics	148-181	A level

Content on other pages may also be useful, including for synoptic questions which bring together learning from across the specification.

Questions

Question T10_Q1

2.	Relative to a fixed origin O ,	
	the point A has position vector $(2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k})$,	
	the point B has position vector $(4\mathbf{i} - 2\mathbf{j} + 3\mathbf{k})$,	
	and the point C has position vector $(a\mathbf{i} + 5\mathbf{j} - 2\mathbf{k})$, where a is a constant and $a < 0$	
	D is the point such that $\overrightarrow{AB} = \overrightarrow{BD}$.	
	(a) Find the position vector of D .	(2)
	Given $ \overrightarrow{AC} = 4$	
	(b) find the value of a.	(3)

Question 2 continued	

10.

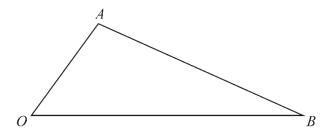

Figure 7

Figure 7 shows a sketch of triangle *OAB*.

The point C is such that $\overrightarrow{OC} = 2\overrightarrow{OA}$.

The point M is the midpoint of AB.

The straight line through C and M cuts OB at the point N.

Given $\overrightarrow{OA} = \mathbf{a}$ and $\overrightarrow{OB} = \mathbf{b}$

(a) Find \overrightarrow{CM} in terms of **a** and **b**

(2)

(b) Show that $\overrightarrow{ON} = \left(2 - \frac{3}{2}\lambda\right) \mathbf{a} + \frac{1}{2}\lambda \mathbf{b}$, where λ is a scalar constant.

(2)

(c) Hence prove that ON: NB = 2:1

(2)

Question 10 continued		

Question 10 continued		

Question 10 continued	

3. Relative to a fixed origin O

 point A has position vector 2i + 5j - 6k point B has position vector 3i - 3j - 4k point C has position vector 2i - 16j + 4k 	
(a) Find \overrightarrow{AB}	(2)
(b) Show that quadrilateral <i>OABC</i> is a trapezium, giving reasons for your answer.	(2)

Question 3 continued	

2. Relative to a fixed origin, points P, Q and R have position vectors \mathbf{p} , \mathbf{q} and \mathbf{r} respectively. Given that • P, Q and R lie on a straight line • Q lies one third of the way from P to Rshow that $\mathbf{q} = \frac{1}{3}(\mathbf{r} + 2\mathbf{p})$ (3)

Question 2 continued	

6.

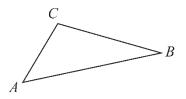

Figure 1

Figure 1 shows a sketch of triangle ABC.

Given that

•
$$\overrightarrow{AB} = -3\mathbf{i} - 4\mathbf{j} - 5\mathbf{k}$$

• $\overrightarrow{BC} = \mathbf{i} + \mathbf{j} + 4\mathbf{k}$

•
$$\overrightarrow{BC} = \mathbf{i} + \mathbf{j} + 4\mathbf{k}$$

(a) find \overrightarrow{AC}

(2)

(b) show that $\cos ABC = \frac{9}{10}$

(3)

Question 6 continued	

Question 6 continued	

Question 6 continued

Note:	Part (b) and part (c) can be marked together.
(a)	Special Case where the point C is believed to be below the origin O
Special	A
Case	M
	0 B
	c´
	Give Special Case M1 A0 in part (a) for $\left\{ \overrightarrow{CM} = \overrightarrow{CA} + \overrightarrow{AM} \Rightarrow \right\} \overrightarrow{CM} = 3\mathbf{a} + \frac{1}{2}(\mathbf{b} - \mathbf{a})$
	Give special case WIT At in part (a) for $\{CM = CA + AM \Rightarrow\} CM = 3\mathbf{a} + -(\mathbf{b} - \mathbf{a})$
	which leads to $\overrightarrow{CM} = \frac{5}{2}\mathbf{a} + \frac{1}{2}\mathbf{b}$

Question	Scheme	Marks	AOs
3 (a)	$\overrightarrow{AB} = (3\mathbf{i} - 3\mathbf{j} - 4\mathbf{k}) - (2\mathbf{i} + 5\mathbf{j} - 6\mathbf{k})$	M1	1.1b
	$= \mathbf{i} - 8\mathbf{j} + 2\mathbf{k}$	A1	1.1b
		(2)	
(b)	States $\overrightarrow{OC} = 2 \times \overrightarrow{AB}$	M1	1.1b
	Explains that as OC is parallel to AB , so $OABC$ is a trapezium.	A1	2.4
		(2)	
			(4 marks)
Notes:			

(a)

M1: Attempts to subtract either way around. If no method is seen it is implied by two of $\pm 1i \pm 8j \pm 2k$.

A1:
$$\mathbf{i} - 8\mathbf{j} + 2\mathbf{k}$$
 or $\begin{pmatrix} 1 \\ -8 \\ 2 \end{pmatrix}$ but not $(1, -8, 2)$

(b)

M1: Compares their i-8j+2k with 2i-16j+4k by stating any one of

•
$$\overrightarrow{OC} = 2 \times \overrightarrow{AB}$$

$$\bullet \quad \begin{pmatrix} 2 \\ -16 \\ 4 \end{pmatrix} = 2 \times \begin{pmatrix} 1 \\ -8 \\ 2 \end{pmatrix}$$

• $\overrightarrow{OC} = \lambda \times \overrightarrow{AB}$ or vice versa

This may be awarded if AB was subtracted "the wrong way around" or if there was one numerical slip

A1: A full explanation as to why *OABC* is a trapezium.

Requires fully correct calculations, so part (a) must be $\overrightarrow{AB} = (\mathbf{i} - 8\mathbf{j} + 2\mathbf{k})$

It requires a reason and minimal conclusion.

Example 1:

 $\overrightarrow{OC} = 2 \times \overrightarrow{AB}$, therefore OC is parallel to AB so OABC is a trapezium

Example 2:

A trapezium has one pair of parallel sides. As $\overrightarrow{OC} = 2 \times \overrightarrow{AB}$, they are parallel, so \checkmark .

Example 3

As
$$\begin{pmatrix} 2 \\ -16 \\ 4 \end{pmatrix} = 2 \times \begin{pmatrix} 1 \\ -8 \\ 2 \end{pmatrix}$$
, OC and AB are parallel, so proven

Example 4

Accept as $\overrightarrow{OC} = \lambda \times \overrightarrow{AB}$, they are parallel so true

Note: There are two definitions for a trapezium. One stating that it is a shape with one pair of parallel sides, the other with **only one** pair of parallel sides. Any calculations to do with sides *OA* and *CB* in this question may be ignored, even if incorrect.

Question Number	Scheme	Marks	AO's
2	Attempts any one of $ (\pm \overrightarrow{PQ} =) \pm (\mathbf{q} - \mathbf{p}), \ (\pm \overrightarrow{PR} =) \pm (\mathbf{r} - \mathbf{p}), \ (\pm \overrightarrow{QR} =) \pm (\mathbf{r} - \mathbf{q}) $ Or e.g.	M1	1.1b
	$(\pm \overrightarrow{PQ} =) \pm (\overrightarrow{OQ} - \overrightarrow{OP}), \ (\pm \overrightarrow{PR} =) \pm (\overrightarrow{OR} - \overrightarrow{OP}), \ (\pm \overrightarrow{QR} =) \pm (\overrightarrow{OR} - \overrightarrow{OQ})$ Attempts e.g. $\mathbf{r} - \mathbf{q} = 2(\mathbf{q} - \mathbf{p})$ $\mathbf{r} - \mathbf{p} = 3(\mathbf{q} - \mathbf{p})$ $\frac{2}{3}(\mathbf{q} - \mathbf{p}) = \frac{1}{3}(\mathbf{r} - \mathbf{q})$ $\mathbf{q} = \mathbf{p} + \frac{1}{3}(\mathbf{r} - \mathbf{p})$ $\mathbf{q} = \mathbf{r} + \frac{2}{3}(\mathbf{p} - \mathbf{r})$	dM1	3.1a
	E.g. $\Rightarrow \mathbf{r} - \mathbf{q} = 2\mathbf{q} - 2\mathbf{p} \Rightarrow 2\mathbf{p} + \mathbf{r} = 3\mathbf{q} \Rightarrow \mathbf{q} = \frac{1}{3}(\mathbf{r} + 2\mathbf{p})^*$	A1*	2.1
		(3)	(3 marks)

Notes:

M1: Attempts any of the relevant vectors by subtracting either way around. This may be implied by sight of any one of $\pm (q-p)$, $\pm (r-q)$ ignoring how they are labelled

dM1: Uses the given information and writes it correctly in vector form that if rearranged would give the printed answer

A1*: Fully correct work leading to the given answer. Allow OQ = ... as long as OQ has been defined as q earlier.

In the working allow use of P instead of p and Q instead of q as long as the intention is clear.

M1: Attempts $\overrightarrow{AC} = \overrightarrow{AB} + \overrightarrow{BC}$

There must be attempt to add not subtract.

If no method shown it may be implied by two correct components

A1: Correct vector. Allow
$$-2\mathbf{i} - 3\mathbf{j} - \mathbf{k}$$
 and $\begin{pmatrix} -2 \\ -3 \\ -1 \end{pmatrix}$ but not $\begin{pmatrix} -2\mathbf{i} \\ -3\mathbf{j} \\ -1\mathbf{k} \end{pmatrix}$

(b)

M1: Attempts to "square and add" for at least 2 of the 3 sides. Follow through on their \overrightarrow{AC} Look for an attempt at either $a^2 + b^2 + c^2$ or $\sqrt{a^2 + b^2 + c^2}$

M1: A correct attempt to apply a correct cosine rule to the given problem; Condone **slips** on the lengths of the sides but the sides must be in the correct position to find angle ABC

A1*: Correct completion with sufficient intermediate work to establish the printed result.

Condone different labelling, e.g. $ABC \leftrightarrow \theta$ as long as it is clear what is meant

It is OK to move from a correct cosine rule $14 = 50 + 18 - 2\sqrt{50}\sqrt{18}\cos ABC$

via
$$\cos ABC = \frac{54}{2\sqrt{50}\sqrt{18}}$$
 o.e. such as $\cos ABC = \frac{\left(5\sqrt{2}\right)^2 + \left(3\sqrt{2}\right)^2 - \left(\sqrt{14}\right)^2}{2 \times 5\sqrt{2} \times 3\sqrt{2}}$ to $\cos ABC = \frac{9}{10}$

Alternative:

M1: Correct application of Pythagoras for sides AB and BC or their squares

M1: Recognises the requirement for and applies the scalar product

A1*: Correct completion with sufficient intermediate work to establish the printed result
