A-level MATHEMATICS

Unit Further Pure 3

Wednesday 18 May 2016

Morning

Time allowed: 1 hour 30 minutes

Materials

For this paper you must have:

- the blue AQA booklet of formulae and statistical tables.

You may use a graphics calculator.

Instructions

- Use black ink or black ball-point pen. Pencil should only be used for drawing.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- Write the question part reference (eg (a), (b)(i) etc) in the left-hand margin.
- You must answer each question in the space provided for that question. If you require extra space, use an AQA supplementary answer book; do **not** use the space provided for a different question.
- Do not write outside the box around each page.
- Show all necessary working; otherwise marks for method may be lost.
- Do all rough work in this book. Cross through any work you do not want to be marked.

Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 75.

Advice

- Unless stated otherwise, you may quote formulae, without proof, from the booklet.
- You do not necessarily need to use all the space provided.

PB/Jun16/E3

MFP3

Answer **all** questions.

Answer each question in the space provided for that question.

- 1 (a)** Find the values of the constants a and b for which $ax + b$ is a particular integral of the differential equation

$$2 \frac{dy}{dx} - 5y = 10x$$

[3 marks]

- (b)** Hence find the general solution of $2 \frac{dy}{dx} - 5y = 10x$.

[3 marks]

QUESTION
PART
REFERENCE

Answer space for question 1

2 (a) Write down the expansion of $\sin 2x$ in ascending powers of x up to and including the term in x^5 .

[1 mark]

(b) It is given that the first non-zero term in the expansion of

$$\sin 2x - 2x(1 - px^2)(1 - x^2)^{-1}$$

in ascending powers of x is qx^5 .

Find the values of the rational numbers p and q .

[4 marks]

QUESTION
PART
REFERENCE

Answer space for question 2

3 (a) It is given that $y(x)$ satisfies the differential equation

$$\frac{dy}{dx} = f(x, y)$$

where $f(x, y) = (2x + 1) \ln(x + y)$

and $y(0) = 2$

Use the improved Euler formula

$$y_{r+1} = y_r + \frac{1}{2}(k_1 + k_2)$$

where $k_1 = hf(x_r, y_r)$ and $k_2 = hf(x_r + h, y_r + k_1)$ and $h = 0.1$, to obtain an approximation to $y(0.1)$, giving your answer to three decimal places.

[5 marks]

(b) It is given that $y(x)$ satisfies the differential equation

$$\frac{dy}{dx} = (2x + 1) \ln(x + y)$$

and $y = 2$ when $x = 0$.

(i) Use implicit differentiation to find $\frac{d^2y}{dx^2}$, giving your answer in terms of x and y .

[3 marks]

(ii) Hence find the first three non-zero terms in the expansion, in ascending powers of x , of $y(x)$. Give your answer in an exact form.

[3 marks]

(iii) Use your answer to part **(b)(ii)** to obtain an approximation to $y(0.1)$, giving your answer to three decimal places.

[1 mark]

QUESTION
PART
REFERENCE

Answer space for question 3

- 4 (a)** The curve with Cartesian equation $\frac{x^2}{c} + \frac{y^2}{d} = 1$ is mapped onto the curve with polar equation $r = \frac{10}{3 - 2 \cos \theta}$ by a single geometrical transformation.

By writing the polar equation as a Cartesian equation in a suitable form, find the values of the constants c and d .

[5 marks]

- (b)** Hence describe the geometrical transformation referred to in part (a).

[1 mark]

QUESTION
PART
REFERENCE

Answer space for question 4

5 (a) Express $\frac{1}{(1+x)(2+x)}$ in the form $\frac{A}{1+x} + \frac{B}{2+x}$, where A and B are integers.

[1 mark]

(b) Use the substitution $u = \frac{dy}{dx}$ to solve the differential equation

$$\frac{d^2y}{dx^2} + \frac{1}{(1+x)(2+x)} \frac{dy}{dx} = \frac{2+x}{1+x}$$

given that $y = 1$ and $\frac{dy}{dx} = 4$ when $x = 0$. Give your answer in the form $y = f(x)$.

[11 marks]

QUESTION
PART
REFERENCE

Answer space for question 5

6 (a) Use the substitution $a = \frac{1}{p}$ to find $\lim_{p \rightarrow \infty} \left[\frac{\ln p}{p^k} \right]$, where $k > 0$.

[3 marks]

(b) Evaluate the improper integral $\int_1^{\infty} \frac{\ln x}{x^7} dx$, showing the limiting process used.

[4 marks]

QUESTION
PART
REFERENCE

Answer space for question 6

7 Find the solution of the differential equation

$$\frac{d^2y}{dx^2} + 4y = 10e^{4x} + 8 \sin 2x + 4 \cos 2x$$

given that $y = 2.5$ when $x = 0$ and $y = \frac{\pi}{4}$ when $x = \frac{\pi}{4}$.

[10 marks]

QUESTION
PART
REFERENCE

Answer space for question 7

- 8 The diagram shows the sketch of part of a curve, the pole O and the initial line.

The polar equation of the curve is $r = 1 + \tan \theta$.

The point A is the point on the curve at which $\theta = \frac{\pi}{3}$.

The perpendicular, AN , from A to the initial line intersects the curve at the point B .

- (a) Find the exact length of OA . [2 marks]
- (b) (i) Given that, at the point B , $\theta = \alpha$, show that $(\cos \alpha + \sin \alpha)^2 = 1 + \frac{\sqrt{3}}{2}$. [4 marks]
- (ii) Hence, or otherwise, find α in terms of π . [2 marks]
- (c) Show that the area of triangle OAB is $\frac{3 + 2\sqrt{3}}{6}$. [2 marks]
- (d) Find, in an exact simplified form, the area of the shaded region bounded by the curve and the line segment AB . [7 marks]
