

1. Given that $y = \arctan\left(\frac{2x}{3}\right)$,

(a) find $\frac{dy}{dx}$, giving your answer in its simplest form.

(2)

(b) Use integration by parts to find

$$\int \arctan\left(\frac{2x}{3}\right) dx$$

(4)

$$1(a) \quad y = \arctan\left(\frac{2x}{3}\right)$$

$$\therefore \tan y = \frac{2x}{3}$$

$$\frac{y^2 + x^2}{x^2} = 1$$

$$\therefore \sec^2 y \frac{dy}{dx} = \frac{2}{3}$$

$$\therefore (\tan^2 y + 1) \frac{dy}{dx} = \frac{2}{3}$$

$$\therefore \left(\frac{4x^2}{9} + 1\right) \frac{dy}{dx} = \frac{2}{3}$$

$$\therefore \frac{4x^2 + 9}{9} \left(\frac{dy}{dx}\right) = \frac{2}{3}$$

$$\therefore \frac{dy}{dx} = \frac{6}{4x^2 + 9}$$

Question 1 continued

$$\text{Let } u = \arctan\left(\frac{2x}{3}\right) \quad u' = \frac{6}{4x^2+9}$$

$$v' = 1 \quad v = x$$

$$\int \arctan \frac{2x}{3} = x \arctan\left(\frac{2x}{3}\right) - \int \frac{6x}{4x^2+9} dx$$

$$= x \arctan\left(\frac{2x}{3}\right) - \frac{3}{4} \int \frac{2x}{4x^2+9} dx$$

$$= x \arctan \frac{2x}{3} - \frac{3}{4} \ln(4x^2+9) + C$$

2. The line with equation $x = 9$ is a directrix of an ellipse with equation

$$\frac{x^2}{a^2} + \frac{y^2}{8} = 1$$

where a is a positive constant.

Find the two possible exact values of the constant a .

(6)

2. Direction

$$x = 9 \Rightarrow \frac{a}{e} = 9 \quad \therefore e = \frac{a}{9}$$

$$\text{Eccentricity: } b = a^2 \left(1 - \frac{a^2}{81} \right)$$

$$\therefore b = a^2 - \frac{a^4}{81}$$

$$\therefore \frac{a^4}{81} - a^2 + 8 = 0 \quad a^4 - 81a^2 + 648 = 0$$

$$\therefore (a^2 - 9)(8a^2 - 9) = 0$$

$$\therefore (a^2 - 72)(a^2 - 9) = 0$$

$$a > 0$$

$$\Rightarrow a^2 = 72 \Rightarrow a = 6\sqrt{2}$$

$$a^2 = 9 \Rightarrow a = 3$$

3. Using the definitions of $\sinh x$ and $\cosh x$ in terms of exponentials,

(a) prove that

$$\cosh^2 x - \sinh^2 x = 1 \quad (2)$$

(b) find algebraically the exact solutions of the equation

$$2 \sinh x + 7 \cosh x = 9$$

giving your answers as natural logarithms.

(5)

(a)

$$\begin{aligned} \text{LHS} &= \cosh^2 x - \sinh^2 x = (\cosh x + \sinh x)(\cosh x - \sinh x) \\ &= \left(\frac{e^x + e^{-x}}{2} + \frac{e^x - e^{-x}}{2} \right) \left(\frac{e^x + e^{-x}}{2} - \frac{e^x - e^{-x}}{2} \right) \\ &= \cancel{e^x} \times \left(\frac{e^x + e^x + e^{-x} - e^{-x}}{2} \right) \left(\frac{e^x - e^x + e^{-x} + e^{-x}}{2} \right) \\ &= e^x \times e^{-x} = 1 = \text{RHS} \end{aligned}$$

as required.

(b) $2 \sinh x + 7 \cosh x = 9$

$$\therefore e^x - e^{-x} + \frac{7}{2}e^x + \frac{7}{2}e^{-x} = 9$$

$$\therefore \frac{9}{2}e^x + \frac{5}{2}e^{-x} = 9$$

$$\therefore 9e^x + 5e^{-x} = 18$$

Question 3 continued

$$\textcircled{x e^x} \therefore 9e^{2x} - 18e^x + 5 = 0$$

$$\therefore (3e^x - 5)(3e^x - 1) = 0$$

$$\therefore e^x = \frac{5}{3} \Rightarrow x = \ln \frac{5}{3} //$$

$$e^x = \frac{1}{3} \Rightarrow x = \ln \frac{1}{3} //$$

4. A non-singular matrix M is given by

$$M = \begin{pmatrix} 3 & k & 0 \\ k & 2 & 0 \\ k & 0 & 1 \end{pmatrix}, \text{ where } k \text{ is a constant.}$$

(a) Find, in terms of k , the inverse of the matrix M .

(5)

The point A is mapped onto the point $(-5, 10, 7)$ by the transformation represented by the matrix

$$\begin{pmatrix} 3 & 1 & 0 \\ 1 & 2 & 0 \\ 1 & 0 & 1 \end{pmatrix}$$

(b) Find the coordinates of the point A .

(3)

$$4(a). \det(M) = 3(2) - k(k) = 6 - k^2$$

$$C = \begin{pmatrix} +(2) & -(k) & +(-2k) \\ -(k) & +(3) & -(-k^2) \\ +(0) & -(0) & +(6-k^2) \end{pmatrix}$$

$$\therefore C^T = \begin{pmatrix} 2 & -k & 0 \\ -k & 3 & 0 \\ -2k & k^2 & 6-k^2 \end{pmatrix}$$

$$\therefore M^{-1} = \frac{1}{6-k^2} \begin{pmatrix} 2 & -k & 0 \\ -k & 3 & 0 \\ -2k & k^2 & 6-k^2 \end{pmatrix}$$

Question 4 continued

(b): $k=1$

$$\therefore M^{-1} = \frac{1}{5} \begin{pmatrix} 2 & -1 & 0 \\ -1 & 3 & 0 \\ -2 & 1 & 5 \end{pmatrix}$$

$$MA = \begin{pmatrix} 5 \\ 10 \\ 7 \end{pmatrix}$$

$$\therefore M^{-1}MA = M^{-1} \begin{pmatrix} -5 \\ 10 \\ 7 \end{pmatrix}$$

$$\therefore A = \frac{1}{5} \begin{pmatrix} 2 & -1 & 0 \\ -1 & 3 & 0 \\ -2 & 1 & 5 \end{pmatrix} \begin{pmatrix} -5 \\ 10 \\ 7 \end{pmatrix}$$

$$\therefore A = \frac{1}{5} \begin{pmatrix} -20 \\ 35 \\ 55 \end{pmatrix}$$

$$\therefore A = (-4, 7, 11)$$

5. Given that

$$I_n = \int_0^{\pi/4} \cos^n \theta d\theta, \quad n \geq 0$$

(a) prove that, for $n \geq 2$,

$$nI_n = \left(\frac{1}{\sqrt{2}}\right)^n + (n-1)I_{n-2} \quad (6)$$

(b) Hence find the exact value of I_5 , showing each step of your working. (5)

Let $\theta = x$

$$5(a). \quad I_n = \int_0^{\pi/4} \cos^n x dx = \int_0^{\pi/4} \cos^{n-1} x \cos x dx$$

~~Let $u = \cos^{n-1} x$ $u' = -\sin x (n-1) \cos^{n-2} x$~~

~~$u' = \cos^2 x$~~

~~$= \frac{\cos 2x + 1}{2}$~~

~~Let $\theta =$~~

Let $u = \cos^{n-1} x$ $u' = -\sin x (n-1) \cos^{n-2} x$

$u' = \cos x$

$u = \sin x$

$$\therefore I_n = \left[\sin x \cos^{n-1} x \right]_0^{\pi/4} + (n-1) \int_0^{\pi/4} \sin^2 x \cos^{n-2} x dx$$

use $\sin^2 x = 1 - \cos^2 x$

$$\therefore I_n = \frac{1}{\sqrt{2}} \left(\frac{1}{\sqrt{2}}\right)^{n-1} + (n-1) \int_0^{\pi/4} \cos^{n-2} x - \cos^n x dx$$

$$\therefore I_n = \left(\frac{1}{\sqrt{2}}\right)^n + (n-1)(I_{n-2} - I_n)$$

$$\therefore I_n = \left(\frac{1}{\sqrt{2}}\right)^n + (n-1)I_{n-2} - (n-1)I_n$$

$$\therefore n I_n = \left(\frac{1}{\sqrt{2}}\right)^n + (n-1)I_{n-2}$$

as required.

(b) ~~I_5~~ let $n=5$

$$5 I_5 = \left(\frac{1}{\sqrt{2}}\right)^5 + 4 I_3$$

$$4 I_3 = \left(\frac{1}{\sqrt{2}}\right)^3 + 2 I_1$$

~~$$I_1 = \int_0^{\pi/4} \cos n \, dx = \left[\sin x \right]_0^{\pi/4} = \frac{1}{\sqrt{2}}$$~~

$$I_1 = \int_0^{\pi/4} \cos n \, dn = \left[\sin n \right]_0^{\pi/4} = \frac{1}{\sqrt{2}}$$

$$\therefore 4 I_3 = \frac{1}{3} \left(\frac{1}{\sqrt{2}}\right)^3 + \frac{2}{3} \left(\frac{1}{\sqrt{2}}\right)$$

$$\therefore 5 I_5 = \left(\frac{1}{\sqrt{2}}\right)^5 + \frac{4}{3} \left(\frac{1}{\sqrt{2}}\right)^3 + \frac{8}{3} \left(\frac{1}{\sqrt{2}}\right)$$

Question 5 continued

$$\therefore 5I_5 = \frac{\sqrt{2}}{8} + \frac{4}{3} \left(\frac{\sqrt{2}}{4} \right) + \frac{8}{3\sqrt{2}}$$

$$\therefore 5I_5 = \frac{43\sqrt{2}}{24}$$

$$\therefore I_5 = \frac{43}{120} \sqrt{2}$$

0-506

6. The hyperbola H has equation

$$\frac{x^2}{16} - \frac{y^2}{4} = 1$$

The line l is a tangent to H at the point $P(4 \cosh \alpha, 2 \sinh \alpha)$, where α is a constant, $\alpha \neq 0$

(a) Using calculus, show that an equation for l is

$$2y \sinh \alpha - x \cosh \alpha + 4 = 0 \quad (4)$$

The line l cuts the y -axis at the point A .

(b) Find the coordinates of A in terms of α . (2)

The point B has coordinates $(0, 10 \sinh \alpha)$ and the point S is the focus of H for which $x > 0$

(c) Show that the line segment AS is perpendicular to the line segment BS . (5)

$$6(a) @ P, \quad \frac{dy}{dx} = \frac{dy/d\alpha}{dx/d\alpha} = \frac{2 \cosh \alpha}{4 \sinh \alpha} = \frac{\cosh \alpha}{2 \sinh \alpha}$$

$$\therefore y - y_1 = m(x - x_1)$$

$$\Rightarrow y - 2 \sinh \alpha = \frac{\cosh \alpha}{2 \sinh \alpha} (x - 4 \cosh \alpha)$$

$$\therefore y - 2 \sinh \alpha = \frac{\cosh \alpha}{2 \sinh \alpha} x - \frac{2 \cosh^2 \alpha}{\sinh \alpha}$$

$$\therefore \textcircled{\times 2 \sinh \alpha} \quad \therefore 2y \sinh \alpha - 4 \sinh^2 \alpha = x \cosh \alpha - 4 \cosh^2 \alpha$$

$$\therefore 2y \sinh \alpha - x \cosh \alpha + 4(\cosh^2 \alpha - \sinh^2 \alpha) = 0$$

$$\Rightarrow 2y \sinh \alpha - x \cosh \alpha + 4 = 0$$

// as required.

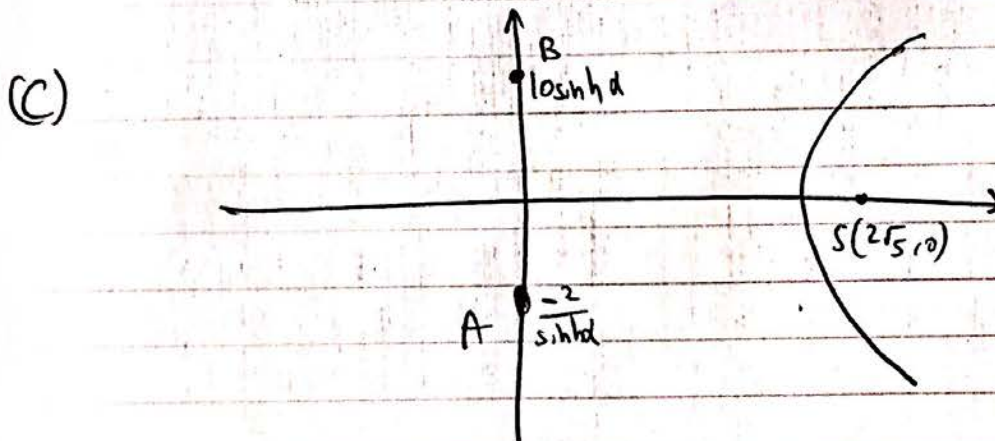

(b) (i) At $\lambda = 0$

$$\therefore 2y \sinh \alpha = -4$$

$$\therefore y = \frac{-2}{\sinh \alpha}$$

$$\therefore A = \left(0, -\frac{2}{\sinh \alpha} \right)$$

$$\text{Gradient AS} = \frac{\frac{-2}{\sinh \alpha}}{2\sqrt{5}} = \frac{1}{\sqrt{5} \sinh \alpha}$$

$$\text{Gradient BS} = \frac{-\cosh \alpha}{2\sqrt{5}} = -\frac{5}{\sqrt{5}} \sinh \alpha = -\sqrt{5} \sinh \alpha$$

$$\therefore \text{Product of gradients} = \frac{1}{\sqrt{5} \sinh \alpha} \times -\sqrt{5} \sinh \alpha = -1$$

\therefore Product of gradients $= -1 \therefore$ BS & AS are perpendicular.

7. The curve C has parametric equations

$$x = 3t^2, \quad y = 12t, \quad 0 \leq t \leq 4$$

The curve C is rotated through 2π radians about the x -axis.

- (a) Show that the area of the surface generated is

$$\pi(a\sqrt{5} + b)$$

where a and b are constants to be found.

(6)

- (b) Show that the length of the curve C is given by

$$k \int_0^4 \sqrt{t^2 + 4} \, dt$$

where k is a constant to be found.

(1)

- (c) Use the substitution $t = 2 \sinh \theta$ to show that the exact value of the length of the curve C is

$$24\sqrt{5} + 12 \ln(2 + \sqrt{5})$$

(6)

$$7(a). \quad x = 3t^2 \quad y = 12t$$

$$\frac{dx}{dt} = 6t \quad \frac{dy}{dt} = 12$$

$$\therefore S = 2\pi \int_0^4 12t \sqrt{36t^2 + 144} \, dt = \frac{1}{3} \pi \int_0^4 72t (36t^2 + 144)^{1/2} \, dt$$

$$= \frac{\pi}{3} \left[\frac{2}{3} (36t^2 + 144)^{3/2} \right]_0^4$$

$$= \frac{\pi}{3} \left(\frac{2}{3} (720)^{3/2} - 1152 \right)$$

$$= \frac{2\pi}{9} (12\sqrt{5})^3 - 384\pi$$

Question 7 continued

$$= \frac{2\pi}{9} \times 1728 \times 5\sqrt{5} - 384\pi$$

$$= 1920\sqrt{5}\pi - 384\pi$$

$$= \pi (1920\sqrt{5} - 384)$$

(c) $S = \int_0^4 \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$

$$\therefore S = \int_0^4 \sqrt{36t^2 + 144} dt$$

$$= \int_0^4 \sqrt{36} \sqrt{t^2 + 4} dt$$

$$\therefore S = 6 \int_0^4 \sqrt{t^2 + 4} dt \quad n=6$$

as required

(c) $t = 2\sinh\theta \Rightarrow \frac{dt}{d\theta} = 2\cosh\theta = 2\sqrt{1+\sinh^2\theta}$
 $= 2\sqrt{1+\frac{t^2}{4}}$

$$\therefore dt = 2\sqrt{1+\frac{t^2}{4}} d\theta \therefore dt = 2\cosh\theta d\theta$$

Question 7 continued

$$\begin{aligned}\sqrt{t^2 + 4} &\equiv \sqrt{(2 \sinh \theta)^2 + 4} \\ &= \sqrt{4 \sinh^2 \theta + 4} \\ &= \sqrt{4(1 + \sinh^2 \theta)} = 2 \cosh \theta\end{aligned}$$

~~Now~~ Consider new limits:

$$t = 4 \Rightarrow 2 \sinh \theta = 4 \Rightarrow \theta = \operatorname{arsinh} 2$$

$$t = 0 \Rightarrow 2 \sinh \theta = 0 \Rightarrow \theta = \operatorname{arsinh} 0 = 0$$

Now:

$$\sqrt{t^2 + 4} = 2 \cosh \theta \quad \& \quad dt = 2 \cosh \theta d\theta$$

$$\therefore 6 \int_0^4 \sqrt{t^2 + 4} dt = 6 \int_0^{\operatorname{arsinh} 2} 2 \cosh \theta \cdot 2 \cosh \theta d\theta$$

$$= 24 \int_0^{\operatorname{arsinh} 2} \cosh^2 \theta d\theta$$

$$= 12 \int_0^{\operatorname{arsinh} 2} \cosh 2\theta + 1 d\theta$$

$$= 12 \left[\frac{1}{2} \sinh 2\theta + \theta \right]_0^{\operatorname{arsinh} 2 = \ln(2 + \sqrt{5})}$$

Question 7 continued

$$= 12 \left(\frac{1}{2} \sinh \ln (2+\sqrt{5})^2 + \ln (2+\sqrt{5}) \right)$$

$$= 12 \left(\frac{1}{4} (e^{\ln (2+\sqrt{5})^2} - e^{-\ln (2+\sqrt{5})^2}) + \ln (2+\sqrt{5}) \right)$$

$$= 12 \left(\frac{1}{4} (9+4\sqrt{5} - (9-4\sqrt{5})) + \ln (2+\sqrt{5}) \right)$$

$$= 3 (8\sqrt{5}) + 12 \ln (2+\sqrt{5})$$

$$= 24\sqrt{5} + 12 \ln (2+\sqrt{5})$$

as required.

(Total 13 marks)

Q7

8. The line l has equation

$$\mathbf{r} = (2\mathbf{i} + \mathbf{j} - 2\mathbf{k}) + \lambda(3\mathbf{i} + 2\mathbf{j} + \mathbf{k}), \text{ where } \lambda \text{ is a scalar parameter,}$$

and the plane Π has equation

$$\mathbf{r} \cdot (\mathbf{i} + \mathbf{j} - 2\mathbf{k}) = 19$$

(a) Find the coordinates of the point of intersection of l and Π .

(4)

The perpendicular to Π from the point $A(2, 1, -2)$ meets Π at the point B .

(b) Verify that the coordinates of B are $(4, 3, -6)$.

(3)

The point $A(2, 1, -2)$ is reflected in the plane Π to give the image point A' .

(c) Find the coordinates of the point A' .

(2)

(d) Find an equation for the line obtained by reflecting the line l in the plane Π , giving your answer in the form

$$\mathbf{r} \times \mathbf{a} = \mathbf{b},$$

where \mathbf{a} and \mathbf{b} are vectors to be found.

(4)

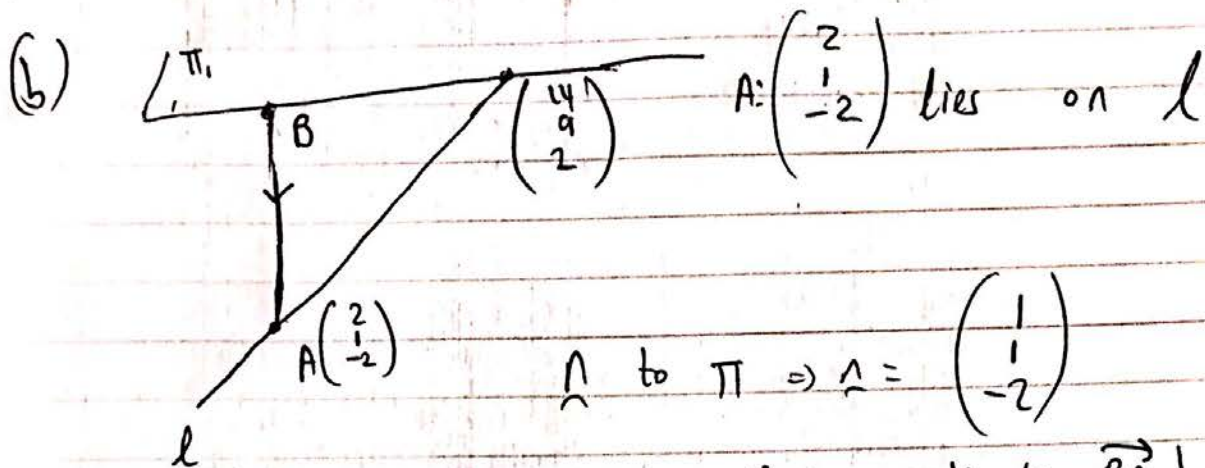

(a) $\Pi: x + y - 2z = 19$

$l: \mathbf{r} = \begin{pmatrix} 2+3\lambda \\ 1+2\lambda \\ -2+\lambda \end{pmatrix}$

$\therefore 2+3\lambda + 1+2\lambda - 2(-2+\lambda) = 19$

$\therefore 3\lambda + 7 = 19 \Rightarrow \lambda = 4$

$\therefore @ \text{ intersection: } \mathbf{r} = \begin{pmatrix} 14 \\ 9 \\ 2 \end{pmatrix}$

* \hat{n} is in direction \vec{BA} !
we need \vec{AB}

$\therefore \vec{AB}$

AB has eqn: $\vec{r} = \begin{pmatrix} 2 \\ 1 \\ -2 \end{pmatrix} + \mu \begin{pmatrix} -1 \\ -1 \\ 2 \end{pmatrix}$

line AB intersects Π : $= \begin{pmatrix} 2 - \mu \\ 1 - \mu \\ -2 + 2\mu \end{pmatrix}$

$\therefore x + y - 2z = 19$

$\Rightarrow 2 - \mu + 1 - \mu - 2(-2 + 2\mu) = 19$

$\therefore 7 - 6\mu = 19$

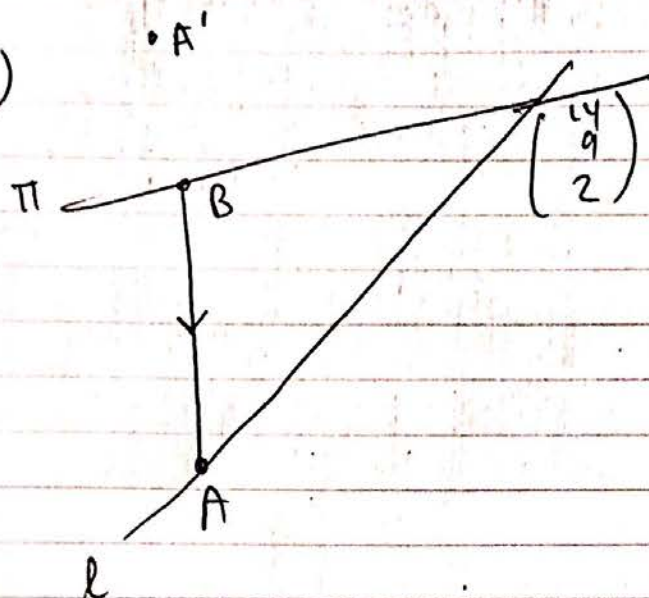

$\therefore \mu = -2$ (a) intersection

\Rightarrow (a) intersection $\vec{r} = \begin{pmatrix} 2 - (-2) \\ 1 - (-2) \\ -2 + 2(-2) \end{pmatrix} = \begin{pmatrix} 4 \\ 3 \\ -6 \end{pmatrix}$

$\therefore B$ has
coords $\begin{pmatrix} 4 \\ 3 \\ -6 \end{pmatrix}$

as required.

(c)

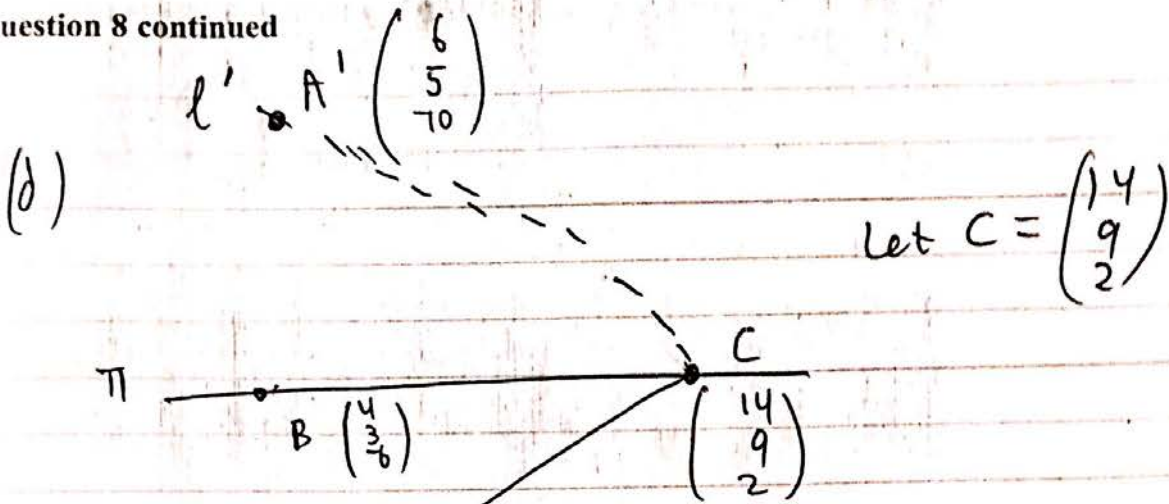

$$OA' = OA + 2AB$$

$$\therefore A' = \begin{pmatrix} 2 \\ 1 \\ -2 \end{pmatrix} + 2 \left(\begin{pmatrix} 4 \\ 3 \\ -6 \end{pmatrix} - \begin{pmatrix} 2 \\ 1 \\ -2 \end{pmatrix} \right)$$

$$= \begin{pmatrix} 2 \\ 1 \\ -2 \end{pmatrix} + 2 \begin{pmatrix} 2 \\ 2 \\ -4 \end{pmatrix}$$

$$A' = \begin{pmatrix} 6 \\ 5 \\ -10 \end{pmatrix}$$

Question 8 continued

$$\overrightarrow{A'C} = \begin{pmatrix} 14 \\ 9 \\ 2 \end{pmatrix} - \begin{pmatrix} 6 \\ 5 \\ -10 \end{pmatrix} = \begin{pmatrix} 8 \\ 4 \\ 12 \end{pmatrix}$$

$$\therefore l' \text{ has eqn } \underline{r} = \begin{pmatrix} 6 \\ 5 \\ -10 \end{pmatrix} + t \begin{pmatrix} 8 \\ 4 \\ 12 \end{pmatrix}$$

$$(\underline{r} - \underline{a}) \times \underline{b} = 0$$

$$\begin{pmatrix} 6 \\ 8 \end{pmatrix} \times \begin{pmatrix} 5 \\ 4 \end{pmatrix} = \begin{pmatrix} -10 \\ 12 \end{pmatrix} \times \begin{pmatrix} 6 \\ 5 \end{pmatrix} = \begin{pmatrix} -10 \\ 12 \end{pmatrix}$$

$$\underline{r} \times \underline{b} = \underline{a} \times \underline{b}$$

$$\therefore \underline{r} \times \begin{pmatrix} 8 \\ 4 \\ 12 \end{pmatrix} = \begin{pmatrix} 6 \\ 5 \\ -10 \end{pmatrix} \times \begin{pmatrix} 8 \\ 4 \\ 12 \end{pmatrix} = \begin{pmatrix} 100 \\ -152 \\ -16 \end{pmatrix}$$

$$\therefore \underline{r} \times \underline{u} \begin{pmatrix} 2 \\ 1 \\ 3 \end{pmatrix} = \begin{pmatrix} 25 \\ -38 \\ -4 \end{pmatrix} \Rightarrow \underline{r} \times \begin{pmatrix} 2 \\ 1 \\ 3 \end{pmatrix} = \begin{pmatrix} 25 \\ -38 \\ -4 \end{pmatrix}$$
