General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

Question Number	Scheme	Notes	Marks
1(a)	$\left(\tanh x = \dfrac{\sinh x}{\cosh x}\right) = \dfrac{\frac{e^x - e^{-x}}{2}}{\frac{e^x + e^{-x}}{2}}$ or $\dfrac{\frac{e^{2x} - 1}{2e^x}}{\frac{e^{2x} + 1}{2e^x}}$	Substitutes the correct exponential forms. Note that the $\tanh x = \dfrac{\sinh x}{\cosh x}$ may be implied.	M1
	$= \dfrac{e^x - e^{-x}}{e^x + e^{-x}} = \dfrac{e^{2x} - 1}{e^{2x} + 1}$*	Correct proof with no errors or omissions or notational errors such as using sin for sinh	A1*
	Note that the question says "starting from the definitions of sinh*x* and cosh*x* in terms of exponentials" so: $\sinh x = \dfrac{e^x - e^{-x}}{2},\ \cosh x = \dfrac{e^x + e^{-x}}{2},\ \tanh x = \dfrac{\sinh x}{\cosh x} = \dfrac{e^x - e^{-x}}{e^x + e^{-x}} = \dfrac{e^{2x} - 1}{e^{2x} + 1}$ scores M1A1 **BUT** $\tanh x = \dfrac{\sinh x}{\cosh x} = \dfrac{e^x - e^{-x}}{e^x + e^{-x}} = \dfrac{e^{2x} - 1}{e^{2x} + 1}$ scores M0A0 as sinh*x* and cosh*x* have not been defined		
			(2)
(b)	$y = \text{artanh}\,\theta \Rightarrow \tanh y = \theta \Rightarrow \theta = \dfrac{e^{2y} - 1}{e^{2y} + 1}$ $\theta\left(e^{2y} + 1\right) = e^{2y} - 1 \Rightarrow e^{2y}(\theta - 1) = -1 - \theta \Rightarrow e^{2y} = \dfrac{1 + \theta}{1 - \theta}$ M1 for setting $\theta = \dfrac{e^{2y} - 1}{e^{2y} + 1}$ or any other variables for θ and *y* e.g. $y = \dfrac{e^{2x} - 1}{e^{2x} + 1}$ and uses correct processing (allow sign errors only) to make $e^{2\text{"}y\text{"}}$ or $e^{\text{"}y\text{"}}$ the subject		M1
	$e^{2y} = \dfrac{1 + \theta}{1 - \theta} \Rightarrow 2y = \ln\left(\dfrac{1 + \theta}{1 - \theta}\right)$	Removes e correctly by taking ln's. **Dependent on the first method mark.**	**d**M1
	$y = \dfrac{1}{2}\ln\left(\dfrac{1 + \theta}{1 - \theta}\right)$* or $\dfrac{1}{2}\ln\dfrac{1 + \theta}{1 - \theta}$* Correct completion with no errors. Must be in terms of θ for this mark but allow "mixed" variables for the M's. This mark should be withheld if there are any errors such as the appearance of a "tan" instead of "tanh" and/or missing variables. The proof does need to convey that $\text{artanh}\,\theta = \dfrac{1}{2}\ln\left(\dfrac{1 + \theta}{1 - \theta}\right)$ So if *y* has been defined as artanhθ and the proof ends $y = \dfrac{1}{2}\ln\left(\dfrac{1 + \theta}{1 - \theta}\right)$, this is acceptable. So must be in terms of θ for the A mark but allow other variables to be used for the M's. Allow arctanh, artanh, $\tanh^{-1}$ etc. for the inverse		A1*
			(3)

	(b) Alternative:		
	$\text{artanh}\,\theta=\frac{1}{2}\ln\left(\frac{1+\theta}{1-\theta}\right)\Rightarrow\theta=\tanh\left(\frac{1}{2}\ln\left(\frac{1+\theta}{1-\theta}\right)\right)$		
	$\theta=\dfrac{e^{\ln\left(\frac{1+\theta}{1-\theta}\right)}-1}{e^{\ln\left(\frac{1+\theta}{1-\theta}\right)}+1}$	Uses part (a) to express θ in terms of e	M1
	$=\dfrac{\frac{1+\theta}{1-\theta}-1}{\frac{1+\theta}{1-\theta}+1}=\dfrac{1+\theta-1+\theta}{1+\theta+1-\theta}=\theta$	Removes e's and ln's **correctly**. **Dependent on the first method mark.**	**d**M1
	$\Rightarrow\text{artanh}\,\theta=\frac{1}{2}\ln\left(\frac{1+\theta}{1-\theta}\right)*$ Allow $\frac{1}{2}\ln\frac{1+\theta}{1-\theta}*$	Obtains $\theta=\theta$ with no errors and makes a conclusion. Must be in terms of θ for this mark but allow a different variable for the M's. This mark should be withheld if there are any errors such as the appearance of a "tan" instead of "tanh" and/or missing variables.	A1*
			(3)
	Attempts that assume $\text{artanh}\,\theta=\dfrac{\text{arsinh}\,\theta}{\text{arcosh}\,\theta}$ score no marks in (b)

(a)	$5\cosh x - 6\sinh x = 0 \Rightarrow 5\left(\frac{e^x + e^{-x}}{2}\right) - 6\left(\frac{e^x - e^{-x}}{2}\right) = 0$	Substitutes the correct exponential forms but allow the "2's" to be missing	M1
	$e^{2x} = 11$	Correct equation	A1
	$x = \ln\sqrt{11}$	Correct value (oe e.g. $\frac{1}{2}\ln 11$)	A1
	Alternative 1

	Alternative 2		
	$5\cosh x - 6\sinh x = 0 \Rightarrow 25\cosh^2 x = 36\sinh^2 x$ $25\left(1+\sinh^2 x\right) = 36\sinh^2 x$ or $25\cosh^2 x = 36\left(\cosh^2 x - 1\right)$ $\sinh^2 x = \frac{25}{11}$ or $\cosh^2 x = \frac{36}{11}$	Rearranges to sinh^2x = … or cosh^2x = …	M1
	$\Rightarrow \sinh x = (\pm)\frac{5}{\sqrt{11}}$ or $\Rightarrow \cosh x = (\pm)\frac{6}{\sqrt{11}}$	Correct equation (Allow ±)	A1
	$x = \ln\sqrt{11}$	Correct value (oe e.g. $\frac{1}{2}\ln 11$)	A1
	Note that this is not a proof so allow "h's" to be lost along the way as long as the intention is clear.

(b)	$(5\cosh x - 6\sinh x)^2 \equiv 25\cosh^2 x - 60\cosh x\sinh x + 36\sinh^2 x$ $\equiv 25\left(\frac{\cosh 2x+1}{2}\right) - 60\frac{1}{2}\sinh 2x + 36\left(\frac{\cosh 2x-1}{2}\right)$ Squares to obtain $p\cosh^2 x + q\cosh x\sinh x + r\sinh^2 x,\quad p,q,r \neq 0$ and attempts to use at least one **correct** "double angle" hyperbolic identity for cosh2*x* or sinh2*x* e.g. $\cosh 2x = \cosh^2 x + \sinh^2 x = 2\cosh^2 x - 1 = 2\sinh^2 x + 1, \sinh 2x = 2\sinh x\cosh x$		M1

		All correct terms in their final expression	A1
			(3)

	$= \frac{61}{2}\cosh 2x - 30\sinh 2x - \frac{11}{2}$	Two correct terms in their final expression	A1

Note on Determinants:

Note that determinants can be found using any row or column

And also by applying the rule of Sarrus which is:

$$\begin{vmatrix}a_{11} & a_{12} & a_{13}\\ a_{21} & a_{22} & a_{23}\\ a_{31} & a_{32} & a_{33}\end{vmatrix} = a_{11}a_{22}a_{33}+a_{12}a_{23}a_{31}+a_{13}a_{21}a_{32}-a_{31}a_{22}a_{13}-a_{32}a_{23}a_{11}-a_{33}a_{21}a_{12}$$
