Notes:

(a) Way 1

M1: A full method to find k such as attempting the square root of the determinant of **M**. It is immediately deducible so the method may be implied by $k = 8$.

A1: $k = 8$

M1: A full method to find a value of θ using their k, no need to justify quadrant. Only one equation needed for this mark. Allow if a radians answer is given. May be implied by a correct angle.

A1: Correct angle in degrees.

Way 2

M1: Multiplies the correct matrix representing transformation Q by the matrix representing transformation P and sets equal to matrix **M**. Allow for the matrices either way round as the transformations commute. No need to see the identity matrix, just multiplying through by k is sufficient.

A1: Both correct equations. Note that if a correct value of k is found, this A is scored under Way 1.

M1: Solves their simultaneous equations to find a value for θ (or k)

A1: $\theta = 120°$ and $k = 8$

(a)	$(\det(\mathbf{M}) =)\ (4)(-7)-(2)(-5)$	M1	1.1a
	$\mathbf{M}$ is non-singular because $\det(\mathbf{M}) = -18$ and so $\det(\mathbf{M}) \neq 0$	A1	2.4
		(2)	
(b)	$\text{Area } R = \dfrac{\text{Area } S}{(\pm)\lvert\det \mathbf{M}\rvert} = \ldots$	M1	1.2
	$\text{Area}(R) = \dfrac{63}{\lvert -18\rvert} = \dfrac{7}{2}$ oe	A1ft	1.1b
		(2)	
(c)	$\begin{pmatrix} 4 & -5 \\ 2 & -7 \end{pmatrix}\begin{pmatrix} x \\ 2x \end{pmatrix} = \begin{pmatrix} 4x-10x \\ 2x-14x \end{pmatrix}$	M1	1.1b
	$= \begin{pmatrix} -6x \\ -12x \end{pmatrix}$ and so all points on $y = 2x$ map to points on $y = 2x$, hence the line is invariant. OR $= -6\begin{pmatrix} x \\ 2x \end{pmatrix}$ hence $y = 2x$ is invariant.	A1	2.1
		(2)	
		(6 marks)	

Notes		
(a)	M1	An attempt to find $\det(\mathbf{M})$. Just the calculation is sufficient. Site of -18 implies this mark, which may be embedded in an attempt at the inverse..
	A1	$\det(\mathbf{M}) = -18$ **and** reference to zero, e.g. $-18 \neq 0$ **and** conclusion. The conclusion may precede finding the determinant (e.g. "Non-singular if $\det(\mathbf{M}) \neq 0$, $\det(\mathbf{M}) = -18 \neq 0$" is sufficient or accept "Non-singular if $\det(\mathbf{M}) \neq 0$, $\det(\mathbf{M}) = -18$, therefore non-singular" or some other indication of conclusion.) Need not mention "$\det(\mathbf{M})$" to gain both marks here, a correct calculation, statement $-18\neq0$, and conclusion hence $\mathbf{M}$ is non-singular can gain M1A1.
(b)	M1	Recalls determinant is needed for area scale factor by dividing 63 by ±their determinant.
	A1ft	$\dfrac{7}{2}$ or follow through $\dfrac{63}{\lvert \text{their det}\rvert}$. Must be positive and should be simplified to single fraction or exact decimal. (Allow if made positive following division by a negative determinant.)
(c)	M1	Attempts the matrix multiplication shown or with equivalent, e.g $\begin{pmatrix} \frac{1}{2}y \\ y \end{pmatrix}$. May use $\begin{pmatrix} x \\ y \end{pmatrix}$ **and** substitute $y = 2x$ later and this is fine for the method.
	A1	Correct multiplication and working leading to conclusion that the line is invariant. If the -6 is not extracted, they must make reference to image points being on line $y = 2x$. If the -6 is extracted to show it is a multiple of $\begin{pmatrix} x \\ 2x \end{pmatrix}$ followed by a conclusion "invariant" as minimum.

Alt for (c)	$\begin{pmatrix} a \\ b \end{pmatrix} = \frac{1}{-18}\begin{pmatrix} -7 & 5 \\ -2 & 4 \end{pmatrix}\begin{pmatrix} x \\ 2x \end{pmatrix} = \frac{-1}{18}\begin{pmatrix} -7x+10x \\ -2x+8x \end{pmatrix}$	M1	1.1b
	$= \frac{-1}{18}\begin{pmatrix} 3x \\ 6x \end{pmatrix}\left(= \frac{-1}{6}\begin{pmatrix} x \\ 2x \end{pmatrix}\right) \Rightarrow b = 2a$ so points on line $y = 2x$ map to points on $y = 2x$, hence it is invariant.	A1	2.1
	Marks as per main scheme,		
Alt 2	(Since linear transformations map straight lines to straight lines…) E.g. $(1, 2)$ is on line $y = 2x$, and $\begin{pmatrix} 4 & -5 \\ 2 & -7 \end{pmatrix}\begin{pmatrix} 1 \\ 2 \end{pmatrix} = \begin{pmatrix} 4-10 \\ 2-14 \end{pmatrix}$	M1	1.1b
	$= \begin{pmatrix} -6 \\ -12 \end{pmatrix}$, which is also on the line $y=2x$, hence as (0,0) and (1,2) both map to points on $y = 2x$ (and transformation is linear) then $y = 2x$ is invariant.	A1	2.1
	Notes		
	M1 Identifies a point on the line $y = 2x$ and finds its image under T. If (0,0) is used there must be a clear statement it is because this is on the line, but for other points accept with any line on $y = 2x$ without statement.		
	A1 Shows the image and another point, which may be (0,0), on $y=2x$ both map to points on $y = 2x$ concludes line is invariant. Need not reference transformation being linear for either mark here.		
Alt 3	$\begin{pmatrix} 4 & -5 \\ 2 & -7 \end{pmatrix}\begin{pmatrix} x \\ mx+c \end{pmatrix} = \begin{pmatrix} X \\ mX+c \end{pmatrix} \Rightarrow \begin{matrix} 4x-5(mx+c)=X \\ 2x-7(mx+c)=mX+c \end{matrix}$ $\Rightarrow 2x-7(mx+c) = m(4x-5(mx+c))+c$ $\Rightarrow (5m^2-11m+2)x+(5m-8)c=0$ $\Rightarrow (5m-1)(m-2)=0 \Rightarrow m = \ldots$ Or similar work with $c = 0$ throughout.	M1	2.1
	$(5m-8 \neq 0 \Rightarrow c = 0)$ Hence $m = 2$ gives an invariant line (with $c = 0$), so $y = 2x$ is invariant.	A1	1.1b
	Notes		
	M1 Attempts to find the equation of a general invariant line, or general invariant line through the origin (so may have $c = 0$ throughout). To gain the method mark they must progress from finding the simultaneous equations to forming a quadratic in m and solving to a value of m.		
	A1 Correct quadratic in m found, with $m = 2$ as solution (ignore the other) and deduction that hence $y = 2x$ is an invariant line. Ignore errors in the $(5m-8)$ here as $c = 0$ is always a possible solution. No need to see $c = 0$ derived.

Notes:

M1: Sets up a matrix equation in an attempt to find a fixed line and extract at least one equation.

A1: Correct equations.

M1: Eliminates X from the simultaneous equations and equates the coefficients of x leading to a quadratic equation in terms of m.

dM1: Dependent on the previous method, finds the value of the discriminant, this can be seen in an attempt to solve the quadratic using the formula.

Alternatively solves $3c=-2mc+c$ and finds a value for m

Note: If the quadratic equation in m is solved on a calculator and complex roots given this is M0 as they are not showing why there are no real roots.

A1: Correct expression for the discriminant, states <0 and draws the required conclusion.

Alternatively, correct value for m, shows a contradiction in $5+3m=4m-2m^2$ and draws the required conclusion.

Notes:
(a)   **B1:** Coordinates of Q correctly stated, accept as a column vector.
(b)   **M1:** Correct attempt to find coordinates of R using the given matrix with $\theta=120$. Must be multiplying in the correct way round. With no working two correct values or (-2.27, 3, -7.93) implies this mark.   **A1:** Correct exact coordinates as shown in scheme. Accept as a column vector. Cos 120 and sin 120 must have been evaluated.
(c)   **M1:** Applies the distance formula with the coordinates of P and their R. Alternatively finds the vector $\overrightarrow{PR}$ or $\overrightarrow{RP}$ then applies length of a vector formula.   **A1:** Correct answer following correct coordinates of R, must be a surd but need not be fully simplified.

(d)

B1ft: Shows the dot product is zero between the vectors $\overline{PR}$ and $\overline{PQ}$ and draws the conclusion perpendicular. Accept with $\pm$ vectors for each. Follow through as long as the vectors are of the correct form, so $\overline{PR} = \begin{pmatrix} a \\ 0 \\ b \end{pmatrix}$ and $\overline{PQ} = \begin{pmatrix} 0 \\ c \\ 0 \end{pmatrix}$

Note They could state if vectors $\overline{PR}$ and $\overline{PQ}$ are perpendicular then $\overrightarrow{PR}.\overrightarrow{PQ} = 0$ then shows $\overrightarrow{PR}.\overrightarrow{PQ} = 0$ this is B1

(e)

M1: Correct method for the area of the triangle, follow through on their coordinates of R and Q. May see longer methods if they do not realise the triangle is right angled.

A1: For $6\sqrt{51}$ cso following correct coordinates of R

Alternative 1

M1 Complete method to find the correct area

Finding all the lengths $|PQ| = 6,\quad |PR| = \sqrt{240} = 4\sqrt{15},\quad |QR| = \sqrt{204} = 2\sqrt{51}$

Use cosine rule to find an angle e.g. $\cos PRQ = \dfrac{240+204-36}{2\times\sqrt{240}\times\sqrt{204}} = \dfrac{\sqrt{85}}{10}$

leading to $PRQ = 22.7\ldots$ or $\sin PRQ = \sqrt{1-\left(\dfrac{\sqrt{85}}{10}\right)^2} = \ldots\left\{\dfrac{\sqrt{15}}{10}\right\}$

Uses the area of the triangle $= \dfrac{1}{2}\times\sqrt{240}\times\sqrt{204}\times\dfrac{\sqrt{15}}{10}$ or $= \dfrac{1}{2}\times\sqrt{240}\times\sqrt{204}\times\sin 22.8$

A1: For $6\sqrt{51}$

Alternative 2

M1: Uses $\dfrac{1}{2}|\mathbf{a}\times\mathbf{b}|$ to find the required area

e.g. $QP = \begin{pmatrix} 0 \\ 6 \\ 0 \end{pmatrix}$ $RP = \begin{pmatrix} 12-\sqrt{3} \\ 0 \\ 3+4\sqrt{3} \end{pmatrix}$ cross product

$$\begin{vmatrix} 0 & 6 & 0 \\ 12-\sqrt{3} & 0 & 3+4\sqrt{3} \end{vmatrix} = -6\left(12-\sqrt{3}\right)\mathbf{i} + 6\left(3+4\sqrt{3}\right)\mathbf{k}$$

Area $= \dfrac{1}{2}\sqrt{\left(-6\left(12-\sqrt{3}\right)^2 + \left(6\left(3+4\sqrt{3}\right)^2\right)\right)} = \dfrac{1}{2}\sqrt{7344}$

A1: For $6\sqrt{51}$
