Solution Bank

Exercise 3F

Let *O* be the origin and *OA* be the positive *x*-axis.

$$7\left(\frac{\overline{x}}{\overline{y}}\right) = 5\left(\frac{2.5}{0.5}\right) + 2\left(\frac{2.5}{2}\right)$$
$$= \frac{1}{7}\left(\frac{17.5}{6.5}\right)$$
$$= \left(\frac{5}{2}\right)$$
$$\frac{13}{14}$$

When the lamina is suspended from O let the angle between OA and the downward vertical be θ .

$$\tan \theta = \frac{\frac{13}{14}}{\frac{5}{2}}$$

 $\theta = 20.376...$
 $= 20.4^{\circ} (3 \text{ s.f.})$

Solution Bank

When the lamina is suspended from O let the angle between OA and the downward vertical be θ .

$$\tan \theta = \frac{\frac{5}{4}}{\frac{33}{12}}$$

 $\theta = 24.443...$
 $= 24.4^{\circ} (3 \text{ s.f.})$

Solution Bank

Let *O* be the origin and *OA* be the positive *x*-axis.

3

$$10\left(\frac{\overline{x}}{\overline{y}}\right) = 4\left(\frac{0.5}{2}\right) + 6\left(\frac{2.5}{3}\right)$$
$$\left(\frac{\overline{x}}{\overline{y}}\right) = \frac{1}{10}\left(\frac{17}{26}\right)$$
$$= \left(\frac{17}{10}\right)$$
$$\frac{13}{5}$$

When the lamina is suspended from O let the angle between OA and the downward vertical be θ .

$$\tan \theta = \frac{\frac{13}{5}}{\frac{17}{10}}$$

 $\theta = 56.821...$
 $= 56.8^{\circ} (3 \text{ s.f.})$

Solution Bank

Let A be the origin

When the lamina is suspended from A let the angle between AB and the downward vertical be θ .

$$\tan \theta = \frac{\frac{53}{26}}{\frac{27}{26}}$$

$$\theta = 63.004...$$

 = 63.0° (3 s.f.)

Angle between AB and downward vertical = 63.004...° (from Q2)
 Therefore, angle between AB and horizontal = 90 - 63.004.... = 27.0° (3 s.f)

Solution Bank

Let P be the origin and PQ be the positive x-axis. Let the point directly below R that lies on PQ be T.

The total area of the shape is:

$$(4 \times 6) + \frac{1}{2}(6 \times 6) = 42$$

Let *PQ* be the origin.
$$42 \left(\frac{\overline{x}}{\overline{y}}\right) = 24 \left(\frac{2}{3}\right) + 18 \left(\frac{6}{2}\right)$$
$$\left(\frac{\overline{x}}{\overline{y}}\right) = \frac{1}{42} \left(\frac{156}{108}\right)$$
$$= \left(\frac{26}{7}\right)$$
$$\frac{18}{7}$$

a Distance from *PS* is $\frac{26}{7}$ cm **b** Distance from *PQ* is $\frac{18}{7}$ cm

Solution Bank

$$\tan \theta = \frac{\frac{18}{7}}{10 - \frac{26}{7}}$$

 $\theta = 22.249...$
 $\theta = 22.2^{\circ} (3 \text{ s.f.})$

Solution Bank

5 Let A be the origin and AF be the positive x-axis.

Solution Bank

Let *F* be the origin and *FE* be the positive *x*-axis.

$$16\left(\frac{\overline{x}}{\overline{y}}\right) = 12\left(\frac{1}{3}\right) + 4\left(\frac{3}{1}\right)$$
$$\left(\frac{\overline{x}}{\overline{y}}\right) = \frac{1}{16}\left(\frac{24}{40}\right)$$
$$= \left(\frac{3}{2}\right)$$
$$= \left(\frac{3}{2}\right)$$

- **a** Therefore centre of mass lies 1.5 cm from *FA*
- **b** Therefore centre of mass lies 2.5 cm from *EF*

$$\tan \theta = \frac{1.5}{2.5} \\ \theta = 30.963... \\ = 31.0^{\circ} (3 \text{ s.f.})$$

Solution Bank

Let *C* be the origin and *CB* be the positive *x*-axis. The centre of gravity of the lamina lies at the point (1, 2)

Solution Bank

Let *B* be the origin.

The centre of gravity of the lamina lies at the point $\left(0, -\frac{2r\sin\alpha}{3\alpha}\right)$

Therefore the centre of gravity of the lamina lies at the point $\left(0, -\frac{16}{3\pi}\right)$

Solution Bank

8 (continued)

$$1.5M\left(\frac{\overline{x}}{\overline{y}}\right) = M\left(\begin{array}{c}0\\-\frac{16}{3\pi}\end{array}\right) + 0.5M\left(\begin{array}{c}2\sqrt{2}\\-2\sqrt{2}\end{array}\right)$$
$$= \frac{1}{1.5}\left(\begin{array}{c}\sqrt{2}\\-\frac{16}{3\pi}-\sqrt{2}\end{array}\right)$$
$$= \left(\begin{array}{c}\frac{2\sqrt{2}}{3}\\-\frac{32}{9\pi}-\frac{2\sqrt{2}}{3}\end{array}\right)$$
$$= \left(\begin{array}{c}0.9428...\\2.0745...\right)$$
$$0.2745...\\0.9428$$
$$\tan \theta = \frac{0.9428...}{2.0745...}$$
$$\theta = 24.4398...$$

Therefore the angle made with *AB* is $45 + 24.4398... = 69.4^{\circ}$ (3 s.f)

Solution Bank

Let *C* be the origin and *CD* be the positive *x*-axis.

The centre of gravity of the lamina lies at the point (2, 3)

A lies at the point (0, 6).

$$(M + kM) \left(\frac{\overline{x}}{\overline{y}}\right) = M \left(\frac{2}{3}\right) + kM \left(\frac{0}{6}\right)$$

$$(1+k) \left(\frac{\overline{x}}{\overline{y}}\right) = \left(\frac{2}{3}\right) + k \left(\frac{0}{6}\right)$$

$$\left(\frac{\overline{x}}{\overline{y}}\right) = \left(\frac{\frac{2}{1+k}}{\frac{3+6k}{1+k}}\right)$$

$$\tan 30 = \frac{\frac{2}{1+k}}{\frac{3+6k}{1+k}}$$

$$\sqrt{3} (3+6k) = 6$$

$$3+6k = \frac{6}{\sqrt{3}}$$

$$k = \frac{1}{\sqrt{3}} - \frac{1}{2} \text{ as required}$$
