MATHEMATICS (MEI)

Mechanics 3

FRIDAY 23 MAY 2008 Morning

Time: 1 hour 30 minutes

Additional materials (enclosed): None

Additional materials (required):

Answer Booklet (8 pages)

Graph paper

MEI Examination Formulae and Tables (MF2)

## **INSTRUCTIONS TO CANDIDATES**

- Write your name in capital letters, your Centre Number and Candidate Number in the spaces provided on the Answer Booklet.
- Read each question carefully and make sure you know what you have to do before starting your answer.
- Answer all the questions.
- You are permitted to use a graphical calculator in this paper.
- Final answers should be given to a degree of accuracy appropriate to the context.
- The acceleration due to gravity is denoted by  $g \, \mathrm{m \, s}^{-2}$ . Unless otherwise instructed, when a numerical value is needed, use g = 9.8.

## INFORMATION FOR CANDIDATES

- The number of marks is given in brackets [] at the end of each question or part question.
- The total number of marks for this paper is 72.
- You are advised that an answer may receive **no marks** unless you show sufficient detail of the working to indicate that a correct method is being used.

This document consists of 4 printed pages.

1 (a) (i) Write down the dimensions of velocity, acceleration and force. [3]

A ball of mass m is thrown vertically upwards with initial velocity U. When the velocity of the ball is v, it experiences a force  $\lambda v^2$  due to air resistance where  $\lambda$  is a constant.

PMT

[3]

(ii) Find the dimensions of 
$$\lambda$$
. [2]

A formula approximating the greatest height H reached by the ball is

$$H \approx \frac{U^2}{2g} - \frac{\lambda U^4}{4mg^2}$$

where g is the acceleration due to gravity.

(iii) Show that this formula is dimensionally consistent. [4]

A better approximation has the form  $H \approx \frac{U^2}{2g} - \frac{\lambda U^4}{4mg^2} + \frac{1}{6}\lambda^2 U^{\alpha} m^{\beta} g^{\gamma}$ .

- (iv) Use dimensional analysis to find  $\alpha$ ,  $\beta$  and  $\gamma$ . [5]
- (b) A girl of mass 50 kg is practising for a bungee jump. She is connected to a fixed point O by a light elastic rope with natural length 24 m and modulus of elasticity 2060 N. At one instant she is 30 m vertically below O and is moving vertically upwards with speed 12 m s<sup>-1</sup>. She comes to rest instantaneously, with the rope slack, at the point A. Find the distance OA.
- 2 A particle P of mass 0.3 kg is connected to a fixed point O by a light inextensible string of length 4.2 m.

Firstly, P is moving in a horizontal circle as a conical pendulum, with the string making a constant angle with the vertical. The tension in the string is 3.92 N.

(i) Find the angle which the string makes with the vertical. [2]

P now moves in part of a vertical circle with centre O and radius 4.2 m. When the string makes an angle  $\theta$  with the downward vertical, the speed of P is v m s<sup>-1</sup> (see Fig. 2). You are given that v = 8.4 when  $\theta = 60^{\circ}$ .

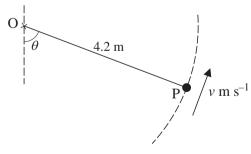

Fig. 2

(iii) Find the tension in the string when  $\theta = 60^{\circ}$ .

(iv) Show that 
$$v^2 = 29.4 + 82.32 \cos \theta$$
. [4]

(v) Find  $\theta$  at the instant when the string becomes slack. [5]

3 A small block B has mass 2.5 kg. A light elastic string connects B to a fixed point P, and a second light elastic string connects B to a fixed point Q, which is 6.5 m vertically below P.

The string PB has natural length 3.2 m and stiffness  $35 \text{ N m}^{-1}$ ; the string BQ has natural length 1.8 m and stiffness  $5 \text{ N m}^{-1}$ .

The block B is released from rest in the position 4.4 m vertically below P. You are given that B performs simple harmonic motion along part of the line PQ, and that both strings remain taut throughout the motion. Air resistance may be neglected. At time *t* seconds after release, the length of the string PB is *x* metres (see Fig. 3).

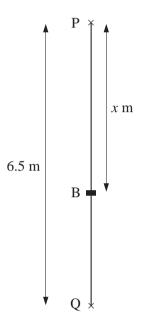

Fig. 3

(i) Find, in terms of x, the tension in the string PB and the tension in the string BQ. [3]

(ii) Show that 
$$\frac{d^2x}{dt^2} = 64 - 16x$$
. [4]

(iii) Find the value of x when B is at the centre of oscillation. [2]

(iv) Find the period of oscillation. [2]

(v) Write down the amplitude of the motion and find the maximum speed of B. [3]

(vi) Find the time after release when B is first moving downwards with speed  $0.9 \,\mathrm{m \, s}^{-1}$ . [4]

## [Question 4 is printed overleaf.]

[4]

- 4 (a) A uniform solid of revolution is obtained by rotating through  $2\pi$  radians about the y-axis the region bounded by the curve  $y = 8 2x^2$  for  $0 \le x \le 2$ , the x-axis and the y-axis.
  - (i) Find the y-coordinate of the centre of mass of this solid. [7]

The solid is now placed on a rough plane inclined at an angle  $\theta$  to the horizontal. It rests in equilibrium with its circular face in contact with the plane as shown in Fig. 4.

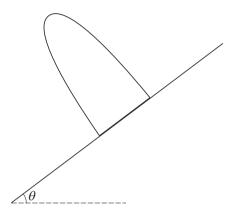

Fig. 4

- (ii) Given that the solid is on the point of toppling, find  $\theta$ .
- (b) Find the y-coordinate of the centre of mass of a uniform lamina in the shape of the region bounded by the curve  $y = 8 2x^2$  for  $-2 \le x \le 2$ , and the x-axis. [7]
